

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,892,900

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
155.	Products infringing: Any product using Microsoft Product Activation or Reader Activation feature.
A virtual distribution environment comprising	
(a) a first host processing environment comprising	computer running a Microsoft product containing the Product Activation feature, including Windows XP, Office XP, Visio 2002. Reader using its activation feature.
(1) a central processing unit;	CPU of computer
(2) main memory operatively connected to said central processing unit;	main memory of computer
(3) mass storage operatively connected to said central processing unit and said main memory;	hard disk or other mass storage contained in computer
(b) said mass storage storing tamper resistant software designed to be loaded into said main memory and executed by said central processing unit, said tamper resistant software comprising:	Microsoft Product Activation software
(1) machine check programming which derives information from one or more aspects of said host processing environment,	Product Activation software generates hardware information relating to the host processing environment as part of the activation process
(2) one or more storage locations storing said information;	hardware information is stored in the computer's storage
(3) integrity programming which	
(i) causes said machine check programming to derive said information,	each time the Microsoft program starts up after initial activation, Product Activation checks the originally derived hardware information against current hardware
(ii) compares said information to information previously stored in said one or more storage locations, and	each time the Microsoft program starts up after initial activation, Product Activation checks the originally derived hardware information against current hardware
(iii) generates an indication based on the result of said comparison; and	Product Activation software indicates whether the test has passed or failed
(4) programming which takes one or more actions based on the state of said indication;	
(i) said one or more actions including at least temporarily halting further processing.	Product Activation software will allow system startup procedures to continue, if test succeeds, or discontinue startup and offer user opportunity to reactivate if the test fails

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,892,900

156.	Product Infringing: Any product using Microsoft Product Activation or Reader Activation feature.
A virtual distribution environment comprising	
(a) a first host processing environment comprising	computer running a Microsoft product containing the Product Activation feature, including Windows XP, Office XP, Visio 2002 and Reader
(1) a central processing unit;	CPU of computer
(2) main memory operatively connected to said central processing unit;	main memory of computer
(3) mass storage operatively connected to said central processing unit and said main memory;	hard disk or other mass storage contained in computer
(b) said mass storage storing tamper resistant software designed to be loaded into said main memory and executed by said central processing unit, said tamper resistant software comprising:	Microsoft Product Activation software
(1) machine check programming which derives information from one or more aspects of said host processing environment,	Product Activation software generates hardware information relating to the host processing environment as part of the activation process
(2) one or more storage locations storing said information;	hardware information is stored in the computer's storage
(3) integrity programming which	
(i) causes said machine check programming to derive said information,	each time the Microsoft program starts up after initial activation, Product Activation checks the originally derived hardware information against current hardware
(ii) compares said information to information previously stored in said one or more storage locations, and	each time the Microsoft program starts up after initial activation, Product Activation checks the originally derived hardware information against current hardware
(iii) generates an indication based on the result of said comparison; and	Product Activation software indicates whether the test has passed or failed
(4) programming which takes one or more actions based on the state of said indication;	
(i) said one or more actions including at least temporarily disabling certain functions.	Product Activation may disable the underlying software from generating new files or running user applications if the test fails

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,892,900

157.	Product Infringing: Any product using Microsoft Product Activation or Reader Activation feature.
A virtual distribution environment comprising	
(a) a first host processing environment comprising	computer running a Microsoft product containing the Product Activation feature, including Windows XP, Office XP, Visio 2002 and Reader
(1) a central processing unit;	CPU of computer
(2) main memory operatively connected to said central processing unit;	main memory of computer
(3) mass storage operatively connected to said central processing unit and said main memory;	hard disk or other mass storage contained in computer
(b) said mass storage storing tamper resistant software designed to be loaded into said main memory and executed by said central processing unit, said tamper resistant software comprising:	Microsoft Product Activation software
(1) machine check programming which derives information from one or more aspects of said host processing environment,	Product Activation software generates hash information relating to the host processing environment as part of the activation process
(2) one or more storage locations storing said information;	hardware information is stored in the computer's storage
(3) integrity programming which	
(i) causes said machine check programming to derive said information,	each time the Microsoft program starts up after initial activation, Product Activation checks the originally derived hardware information against current hardware
(ii) compares said information to information previously stored in said one or more storage locations, and	each time the Microsoft program starts up after initial activation, Product Activation checks the originally derived hardware information against current hardware
(iii) generates an indication based on the result of said comparison; and	Product Activation software indicates whether the test has passed or failed
(4) programming which takes one or more actions based on the state of said indication;	
(i) said one or more actions including displaying a message to the user.	Product Activation software displays a message to the user if the test fails

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,892,900

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
156.	Products infringing: Windows Media Player
A virtual distribution environment comprising a first host processing environment comprising	WMP with Individualized DRM client (referred to hereafter as the Individualized WMP) running on a client computer
a central processing unit	Client CPU
main memory operatively connected to said central processing unit	Client memory
mass storage operatively connected to said central processing unit and said main memory	Local disk drive
said mass storage storing tamper resistant software designed to be loaded into said main memory and executed by said central processing unit, said tamper resistant software comprising:	Individualized WMP (I-WMP) stored on disk and loaded into main memory upon execution. I-WMP is tamper resistant.
machine check programming which derives information from one or more aspects of said host processing environment,	Individualization module is generated by the MS individualization service either when the un-individualized WMP tries to open licensed content that requires a security upgrade (aka, Individualization) or when the user requests an upgrade un-provoked. The individualization module is unique and signed and is bound to a unique hardware ID using the MS machine activation process.
one or more storage locations storing said information	The aforementioned unique feature are located in multiple places or storage locations
integrity programming which	
causes said machine check programming to derive said information,	The ID is regenerated by WMP/DRM client when first loading the Individualized DRM Client to access a piece of content requiring the security upgrade.
compares said information to information previously stored in said one or more storage locations, and	The program checks the new copy against the one to which the Individualized DRM client is bound.
generates an indication based on the result of said comparison; and	Program stores the result of this check.
programming which takes one or more actions based on the state of said indication	If these are not equal, the user is notified via a message stating that he/she must acquire a security upgrade (that is, the current security upgrade is invalid). If they are equal then processing of songs requiring Individualization continues.
said one or more actions including at least temporarily disabling certain functions.	Songs targeted to this Individualization module cannot be accessed until the upgrade is correct.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.

157. A virtual distribution environment comprising	Infringing products include: Windows Media Player
a first host processing environment comprising	See 156
a central processing unit	See 156
main memory operatively connected to said central processing unit	See 156
mass storage operatively connected to said central processing unit and said main memory	See 156
said mass storage storing tamper resistant software designed to be loaded into said main memory and executed by said central processing unit, said tamper resistant software comprising:	See 156
machine check programming which derives information from one or more aspects of said host processing environment,	See 156
one or more storage locations storing said information	See 156
integrity programming which causes said machine check programming to derive said information compares said information to information previously stored in said one or more storage locations, and	See 156
generates an indication based on the result of said comparison; and	See 156
programming which takes one or more actions based on the state of said indication	See 156
said one or more actions including displaying a message to the user.	If these are not equal, the user is notified via a message stating that he/she must acquire a security upgrade (that is, the current security upgrade is invalid).

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,892,900

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
157.	Infringing Product: Microsoft's Windows File Protection and System File Checker features, embodied in Microsoft's Windows 2000, Windows XP products, and Server 2003
A virtual distribution environment comprising	
(a) a first host processing environment comprising	computer running Microsoft Windows 2000 or Windows XP.
(1) a central processing unit;	CPU of computer
(2) main memory operatively connected to said central processing unit;	main memory of computer
(3) mass storage operatively connected to said central processing unit and said main memory;	hard disk or other mass storage contained in computer
(b) said mass storage storing tamper resistant software designed to be loaded into said main memory and executed by said central processing unit, said tamper resistant software comprising:	Windows File Protection process/service ("WFP") and System File Checker (SFC.exe) features of winlogon.exe. Winlogon.exe is treated as a "critical" service by the Windows operating system. Files supporting WFP (including winlogon.exe, sfc.exe, sfc.dll (2000 only), sfcfiles.dll (2000 only) and sfc_os.dll (XP only)) are "protected" files and are signed using a signature verified by a hidden key. In Windows 2000, WFP uses hidden functions within the sfc.dll library. Functions are imported by "ordinal" instead of "name."
(1) machine check programming which derives information from one or more aspects of said host processing environment,	Winlogon either directly or using another dll (XP) or using SFC.dll (2000) determines if changed file was protected, computes the hash of protected files and, if necessary, computes the hash of the file in the dll cache before using it to replace a file overwritten by an incorrect version of the file.
(2) one or more storage locations storing said information;	hardware information is stored in the computer's memory
(3) integrity programming which	
(i) causes said machine check programming to derive said information,	Windows notifies Winlogon when there has been a system directory change or a change in the dll cache.
(ii) compares said information to information previously stored in said one or more storage locations, and	Winlogon either directly or using another dll (XP) or using SFC.dll (2000) compares computed hash with hash in the hash database created from the Catalog file(s), and, if there is a difference, compares the hash of the file in the dll cache to the hash database created from

	the Catalog file(s) before using it to replace an overwritten file.
(iii) generates an indication based on the result of said comparison; and	An event is written to the Event Viewer if hashes do not agree.
(4) programming which takes one or more actions based on the state of said indication;	Depending on the circumstances, WFP displays several messages to the user, including prompting the user to contact the system administrator, and to insert a CD-ROM.
(i) said one or more actions including displaying a message to the user.	See above. Messages also constitute viewable Event Property pop-ups.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,917,912

CLAIM LANGUAGE	CLAIM OR INFRINGEMENT
6.	Product Infringing: XBox
A process comprising the following steps:	The process constitutes assembly and use of components making up an XBox game.
accessing a first record containing information directly or indirectly identifying one or more elements of a first component assembly,	The first record consists of the second file table on an XBox DVD. This table identifies the .xbe file which includes the game information.
at least one of said elements including at least some executable programming,	The xbe file includes executable programming.
at least one of said elements constituting a load module,	The xbe file is a load module.
said load module including executable programming and a header;	The xbe file includes a header.
at least a portion of said header is a public portion which is characterized by a relatively lower level of security protection; and	Most information the xbe header is not obfuscated.
at least a portion of said header is a private portion which is characterized, at least some of the time, by a level of security protection which is relatively higher than said relatively lower level of security protection,	The entry point address and the kernel image thunk address listed in the xbe header are obfuscated and therefore at a higher level of security protection.
using said information to identify and locate said one or more elements;	The second file table identifies the .xbe file, including where that file is located.
accessing said located one or more elements;	The .xbe file is accessed by the XBox.
securely assembling said one or more elements to form at least a portion of said first component assembly;	<p>At runtime, the .xbe file is assembled with certain services of the operating system to form a component assembly. Security associated with this assembling process includes verifying signatures associated with portions of the .xbe file, and replacing obfuscated calls to operating system services with actual addresses.</p> <p>The assembly may also include patch files downloaded from a remote server.</p>
executing at least some of said executable	Game play requires execution of the

programming; and checking said record for validity prior to performing said executing step.	assembled programming. The second file table is protected by a digital signature, and is not loaded/used unless the digital signature is verified against the file.
7. A process as in claim 6 in which: said relatively lower level of security protection comprises storing said public header portion in an unencrypted state; and said relatively higher level of security protection comprises storing said private header portion in an encrypted state.	The header is protected by the techniques protecting the xbe such as signing and security descriptors, but it is not encrypted except as noted below. The entry point address and the kernel image thunk address listed in the xbe header are obfuscated. The Xbox SDK's (XDK) image build uses a key value shared with the retail Xbox to perform two XOR operations against the addresses

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,917,912

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
8.	Infringing products: Microsoft CLR or CCLR and .NET Framework SDK and products that include one or both of these.
A process comprising the following steps:	
(a) accessing a first record containing information directly or indirectly identifying one or more elements of a first component assembly,	The first record is either an assembly manifest, or a whole assembly; the elements are other assemblies that are referenced as external in the first record; the first component assembly is a .NET application domain.
(1) at least one of said elements including at least some executable programming,	Assembly contains executable programming.
(2) at least one of said elements constituting a load module,	This is an external assembly referenced in the first record.
(i) said load module including executable programming and a header;	Assemblies include executable programming, and the assembly manifest and CLS type metadata constitute a header.
(ii) said header including an execution space identifier identifying at least one aspect of an execution space required for use and/or execution of the load module associated with said header;	This feature is provided for in the .NET architecture through numerous mechanisms, for example, by demands for ZoneID permissions.
(iii) said execution space identifier provides the capability for distinguishing between execution spaces providing a higher level of security and execution spaces providing a lower level of security;	SecurityZone or other evidence provides this capability.
(b) using said information to identify and locate said one or more elements;	Manifest and type metadata information section is used to identify and locate files, code elements, resource elements, individual classes and methods.
(c) accessing said located one or more elements;	Step carried out by the CLR or CCLR loader.
(d) securely assembling said one or more elements to form at least a portion of said first component assembly;	CLR or CCLR carries out this step, including checking the integrity of the load module, checking the load module's permissions, placing the load module contents into an application domain, isolating it from malicious or badly behaved code, and from code that does not have the permission to call it.
(e) executing at least some of said executable programming; and	Step carried out by the CLR/CCLR and the CLR/CCLR host.

(f) checking said record for validity prior to performing said executing step.	The CLR/CCLR checks the authenticity and the integrity of the first .NET assembly.
9. A process as in claim 8 in which said execution space providing a higher level of security comprises a secure processing environment.	The CLR/CCLR constitutes a secure processing environment.
13. A process as in claim 8 further comprising:	
(a) comparing said execution space identifier against information identifying the execution space in which said executing step is to occur; and	In one example, the ZoneIdentityPermissionAttribute SecurityZone value demanded by control in the assembly manifest is compared against the SecurityZone attribute value corresponding to the calling method
(b) taking an action if said execution space identifier requires an execution space with a security level higher than that of the execution space in which said executing step is to occur.	CLR/CCLR will throw an exception and transfer control to an exception handler in the calling routine, or it will shut down the application if there is no such exception handler, if the permissions do not include the permissions required by the ZoneIdentityPermissionAttribute. The ZoneIdentityPermissions are hierarchical, unless customized.
14. A process as in claim 13 in which said action includes terminating said process prior to said executing step.	CLR/CCLR may terminate the process or transfer control to an exception handler that may itself terminate the process.

INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,917,912

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
8.	Products infringing include Windows Installer SDK, and products that include the Windows Installer technology.
A process comprising the following steps:	<p>Scenario 1: use of Windows Installer packages (i.e. .MSI files) to create Windows Installer-enabled applications, such as Office 2000 and used of the WI service to install them.</p> <p>Scenario 2: software distribution technologies that use the Windows Installer OS service for installation, such as Internet Component Download and products like Office Web Components.</p> <p>Either scenario can be used by SMS, IntelliMirror and third party tools like InstallShield and WISE.</p> <p>NT or later operating systems (because they use the subsystem identifier)</p> <p>using cabinet files, .CAB, (because they have a manifest and INF and/or OSD files), and have been signed with a digital signature and will be authenticated by Authenticode or WinVerifyTrust API and contain at least one PE (portable executables)</p>
(a) accessing a first record containing information directly or indirectly identifying one or more elements of a first component assembly,	<p>Scenario 1: First record is the .MSI file that contains information on what goes in the assembly and how to install the assembly.</p> <p>Scenario 2:</p> <p>A. First record is the cabinet manifest (indirect instructions)</p> <p>B. Or, First record can be INF and/or OSD files (direct instructions)</p>
(1) at least one of said elements including at least some executable programming,	Both scenarios: The PE (portable executable) in the cabinet file is the executable programming.
(2) at least one of said elements constituting a load module,	Both scenarios: PE is a load module:
(i) said load module including executable programming and a	Both scenarios: The PE has several headers.

header;	
(ii) said header including an execution space identifier identifying at least one aspect of an execution space required for use and/or execution of the load module associated with said header;	Both scenarios: SUBSYSTEM is a field in the PE Optional Header that is an execution space
(iii) said execution space identifier provides the capability for distinguishing between execution spaces providing a higher level of security and execution spaces providing a lower level of security;	Both scenarios: SUBSYSTEM distinguishes between programs that can run in kernel mode and those that can run in user mode. This is a key security concept of process separation that was introduced with Windows NT. The Subsystem field in the PE header is used by the system to indicate whether the executable will run within Ring 3 (user mode) or use Ring 0 (native or kernel mode). Anything running in Ring 3 is limited to its own processing space. Executables running in Ring 0 can reach out to other spaces and have security measure built around them.
(b) using said information to identify and locate said one or more elements;	Scenario 1: the MSI file identifies and locates the elements Scenario 2: .CAB manifest is used to identify Physical location OSD and/or INF is used to identify Logical location
(c) accessing said located one or more elements;	Scenario 1: Using the MSI file Scenario 2: Using INF and/or OSD in cabinet file
(d) securely assembling said one or more elements to form at least a portion of said first component assembly;	Both scenarios: Using the Window Installer OS service with various properties and flags on the settings for higher protection. Windows Installer has numerous flags that the developer can set to indicate how the assembly will be installed, in what privilege level, with how much user interface, and how much ability the user has to watch or change what is occurring. These controls have been strengthened with each release of Windows Installer. Windows Installer 1.1 and later has the ability to limit the users capabilities during the installation. In a Windows 2000

environment and later, using the Group Policy-based Change and Configuration Management, the administrator has the most control

Fields that can be set by the developer or administrator to control what users can do include the following:

Transformssecure can be set to a value of 1 to inform the installer that transforms are to be cached locally on the user's computer in a location the user does not have write access. (Transforms create custom installations from a basic generic installation, for example to make the Finance versions different from the Marketing version or English versions different from Japanese versions.)

AllowLockdownBrowse and *DisableBrowse* can prevent users from browsing to the sources.

SourceList can be used to specify the only allowable source to be used for the installation of a given component.

Environment can be used to specify whether the installation can be done while the user is logged on or only when no user is logged on.

Security Summary Property conveys whether a package can be opened as read-only or with no restriction.

Privileged Property is used by developers of installer packages to make the installation conditional upon system policy, the user being an administrator, or assignment by an administrator.

Restricted Public Properties can be set as variables for an installation. "For managed installations, the package author may need to limit which public properties are passed to the server side and can be changed by a user that is not a system administrator. Some are commonly necessary to maintain a secure environment when the installation requires the installer use elevated privileges."

SecureCustomProperties can be created by the author of an installation package to add controls beyond the default list.

MsiSetInternalUI specifies the level of user interface from none to full.

A *Sequence Table* can be used to specify the required order of execution for the installation process. There are three modes, one of which is the *Administrative Installation* that is used by the network administrator to assign and install applications.

InstallServicesAction registers a service for the system and it can only be used if the user is

	<p>an administrator or has elevated privileges with permission to install services or that the application is part of a managed installation.</p> <p><i>DisableMedia</i> system policy disables media sources and disables browsing to media sources. It can be used with <i>DisableBrowse</i> to secure installations version 1.1 that doesn't have some of the other capabilities.</p> <p><i>AlwaysInstallElevated</i> can be set per user or per machine and is used to install managed applications with elevated privileges.</p> <p>AllowLockdownBrowse, AllowLockdownMedia and AllowLockdownPatch set these capabilities so they can only be performed by an administrator during an elevated installation.</p> <p>[See article "HowTo: Configure Windows Installer for Maximum Security (Q247528)."</p> <p>Windows XP Professional and .NET have the additional capability to set <i>Software Restriction Policies</i> and have these used by Windows Installer.</p> <p>In addition, most of the software distribution technologies that use Windows Installer also add a layer of their own controls. For example, SMS 2.0 enables the administrators to control the installation is optional or required and whether the user can affect the installation contents/features at all.</p>
(e) executing at least some of said executable programming; and	<p>Both scenarios: Part of executable is called during installation in order to do self-registration or perform custom actions. The overall executable is used at runtime.</p>
(f) checking said record for validity prior to performing said executing step.	<p>Scenario 1: Sign the overall package and the cabinet files.</p> <p>Scenario 2: The cabinet file is signed.</p> <p>For IE with the default security level or higher, the digital signature is verified by Authenticode or a similar utility before the component is allowed to be assembled.</p>

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,917,912

35.	Products infringing include all products that host the Microsoft .NET Common Language Runtime or Compact Common Language Runtime.
A process comprising the following steps:	
(a) at a first processing environment receiving a first record from a second processing environment remote from said first processing environment;	Computer running the Microsoft CLR/CCLR receives, for example, a shared assembly header or a complete shared assembly from another computer, for example a server.
(1) said first record being received in a secure container;	The shared assembly is cryptographically hashed and signed.
(2) said first record containing identification information directly or indirectly identifying one or more elements of a first component assembly;	The first record is either an assembly manifest, or a whole assembly; the elements are other assemblies that are referenced as external in the first record; the first component assembly is a .NET application domain.
(i) at least one of said elements including at least some executable programming;	Assembly contains executable programming.
(ii) said component assembly allowing access to or use of specified information;	The specified information can include any kind of data file, stream, log, environment variables, etc.
(3) said secure container also including a first of said elements;	The shared assembly includes at least some executable programming.
(b) accessing said first record	CLR/CCLR accesses the assembly or assembly header.
(c) using said identification information to identify and locate said one or more elements;	Manifest and type metadata information section is used to identify and locate files, code elements, resource elements, individual classes and methods.
(1) said locating step including locating a second of said elements at a third processing environment located remotely from said first processing environment and said second processing environment;	Met by a multifile assembly, with files distributed across a network, or by the second element constituting another referenced assembly located elsewhere; the CLR/CCLR uses probing to locate and access the file.
(d) accessing said located one or more elements;	Step carried out by the CLR/CCLR loader.
(1) said element accessing step including retrieving said second element from said third processing environment;	Step carried out by the CLR/CCLR loader.
(e) securely assembling said one or more elements to form at least a portion of said first component assembly specified by said first record; and	CLR/CCLR carries out this step, including checking the integrity of the load module, checking the load module's permissions, placing the load module contents into an application domain, isolating it from malicious or badly behaved code, and from code that

	does not have the permission to call it.
(f) executing at least some of said executable programming.	Step carried out by the CLR/CCLR.
(1) said executing step taking place at said first processing environment.	CLR/CCLR is operating in the first processing environment specified above.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,920,861

34.	Product Infringing: Microsoft Operating Systems that support device driver signature technology
A descriptive data structure embodied on a computer-readable medium or other logic device including the following elements:	
a representation of the format of data contained in a first rights management data structure	<p>The driver package's INF is a data structure. The INF contains multiple types of sections, structured as hierarchy /"branches," that the Windows operating system or its Plug and Play and/or Set-up installation services "branch" through based on the operating system information and device for which a driver is to be installed. The installation services use the "branching" structure (format) to determine what files should be installed. The INF, further provides disk location information and file directory path information for the files identified as necessary as a result of the "branching" process.</p> <p>The driver package is a "rights management" data structure based on the fact that it is governed and based on the fact that it processes governed information.</p> <p><u>Rights Management as Governed Item</u></p> <p>A driver manufacturer can include rules governing the driver's installation and/or use in the driver's INF file. For example:</p> <p>Security entries specify an access control list for the driver.</p> <p>Driver developers can specify rules that determine behavior of the driver package based on the user's operating system version, including product type and suite and the device for which the driver is to be installed</p> <p>Rules specifying logging</p> <p>Local administrators can establish policy as to what action or notification should occur in the event that a driver being installed is not signed.</p>

1		The operating system installation services have a ranking criteria it follows when multiple drivers are available for a newly detected device. The criterion is used to determine the driver best suited for ensuring compatibility with the operating system and ensuring functionality of the device.
2		
3		
4		
5		
6		Drivers have been certified to be compatible with specified operating system versions for their respective device classes. The catalog file protects the integrity of the driver.
7		
8		
9		Microsoft distributes the Driver Protection List to prevent known bad driver from being installed.
10		
11		<u>Processing Rights Managed Items</u>
12		Certain drivers (SAP) have been explicitly certified to protect DRM content.
13		<u>MSDN – DRM Overview</u>
14		A DRM-compliant driver must prevent unauthorized copying while digital content is being played. In addition, the driver must disable all digital outputs that can transmit the content over a standard interface (such as S/PDIF) through which the decrypted content can be captured.
15		
16		
17		
18	said representation including:	
19	element information contained within	The elements of a driver package include:
20	said first rights management data	A driver that is typically a dynamic-link library with the .sys filename extension.
21	structure; and	An INF file containing information that the system Setup components use to install support for the device.
22		A driver catalog file containing the digital signature.
23		One or more optional co-installers which are a Win32® DLL that assists in device installation NT-based operating systems.
24		Other files, such as a device installation application, a device icon, and so forth.
25		
26		<u>XP DDK – INF Version Section</u>
27		The LayoutFile entry specifies one or more additional system-supplied INF files that contain layout information on the source media required for installing the software

	<p>described in this INF. All system-supplied INF files specify this entry.</p> <p>The CatalogFile entry specifies a catalog (.cat) file to be included on the distribution media of a device/driver.</p>
organization information regarding the organization of said elements within said first rights management data structure; and	<p>Within an INF is a hierarchy with the top being a list of manufacturers, and sub-lists of models and at the bottom a list of install information by model.</p> <p>For Windows XP and later versions of NT-based operating systems, entries in the Manufacturer section can be decorated to specify operating system versions. The specified versions indicate OS versions with which the specified INF <i>Models</i> sections will be used. If no versions are specified, Setup uses the specified <i>Models</i> section for all versions of all operating systems.</p> <p>INF's SourceDisksNames and SourceDisksFiles sections specify organization information.</p> <p><u>XP DDK -- Source Media for INFs</u></p> <p>The methods you should use to specify source media for device files depend on whether your INFs ship separately from the operating system or are included with the operating system.</p> <p>INFs for drivers that are delivered separately from the operating system specify where the files are located using SourceDisksNames and SourceDisksFiles sections.</p> <p>If the files to support the device are included with the operating system, the INF must specify a LayoutFile entry in the Version section of the file. Such an entry specifies where the files reside on the operating system media. An INF that specifies a LayoutFile entry must not include SourceDisksNames and SourceDisksFiles sections.</p> <p><u>XP DDK -- INF SourceDisksNames Section</u></p> <p>A SourceDisksNames section identifies the distribution disks or CD-ROM discs that contain the source files to be transferred to the target machine during installation. Relevant values of an entry in the INF include:</p> <p><i>diskid</i> -- Specifies a source disk.</p> <p><i>disk-description</i> -- Describes the contents</p>

1		and/or purpose of the disk identified by <i>diskid</i> .
2		<i>tag-or-cab-file</i> -- This optional value
3		specifies the name of a tag file or cabinet file
4		supplied on the distribution disk, either in
5		the installation root or in the subdirectory
6		specified by <i>path</i> , if any.
7		<i>path</i> -- This optional value specifies the
8		path to the directory on the distribution
9		disk containing source files. The <i>path</i> is
10		relative to the installation root and is
11		expressed as <i>dirname\dirname2...</i> and so
12		forth.
13		<i>flags</i> -- For Windows XP and later, setting
14		this to 0x10 forces Setup to use <i>cab-or-tag-</i>
15		<i>file</i> as a cabinet file name, and to use <i>tag-</i>
16		<i>file</i> as a tag file name. Otherwise, <i>flags</i> is
17		for internal use only.
18		<i>tag-file</i> -- For Windows XP and later, if
19		<i>flags</i> is set to 0x10, this optional value
20		specifies the name of a tag file supplied on
21		the distribution medium, either in the
22		installation root or in the subdirectory
23		specified by <i>path</i> . The value should specify
24		the file name and extension without path
25		information.
26	information relating to metadata, said metadata including:	<u>XP DDK -- INF SourceDisksFiles Section</u> A <i>SourceDisksFiles</i> section names the source files used during installation, identifies the source disks (or CD-ROM discs) that contain those files, and provides the path to the subdirectories, if any, on the distribution disks containing individual files. Relevant values in an entry in the INF would include: <i>filename</i> -- Specifies the name of the file on the source disk. <i>diskid</i> -- Specifies the integer identifying the source disk that contains the file. This value and the initial <i>path</i> to the <i>subdir(ectory)</i> , if any, containing the named file must be defined in a <i>SourceDisksNames</i> section of the same INF. <i>subdir</i> -- This optional value specifies the subdirectory (relative to the <i>SourceDisksNames path</i> specification, if any) on the source disk where the named file resides.
27	metadata rules used at least in part to govern at least one aspect of use and/or display of content stored within a rights management data structure,	The driver manufacture can specify rules in the INF that govern the installation and/or use of the driver. For example, security entries specify an access control list for the

driver. Driver developers can specify rules in an INF file that determines behavior of the driver package based on the user's operating system version, including product type and suite. Also, rules related to logging can be specified as mentioned in next claim element.

For Example – Access Control List Rules

XP DDK – Tightening File-Open Security in a Device INF File

For Microsoft Windows 2000 and later, Microsoft tightened file-open security in the class installer INFs for certain device classes, including CDROM, DiskDrive, FDC, FloppyDisk, HDC, and SCSIAdapter.

If you are unsure whether the class installer for your device has tightened security on file opens, you should tighten security by using the device's INF file to assign a value to the **DeviceCharacteristics** value name in the registry. Do this within an *add-registry-section*, which is specified using the INF AddReg directive.

XP-DDK -- INF AddReg Directive

An INF can also contain one or more optional *add-registry-section.security* sections, each specifying a security descriptor that will be applied to all registry values described within a named *add-registry-section*.

A **Security** entry specifies a security descriptor for the device. The *security-descriptor-string* is a string with tokens to indicate the DACL (D:) security component. A class-installer INF can specify a security descriptor for a device class. A device INF can specify a security descriptor for an individual device, overriding the security for the class. If the class and/or device INF specifies a *security-descriptor-string*, the PnP Manager propagates the descriptor to all the device objects for a device, including the FDO, filter DOs, and the PDO.

For Example – Operating System Versioning

Operating-System Versioning for Drivers

1		under Windows XP
2		Setup selects the [<i>Models</i>] section to use
3		based on the following rules:
4		If the INF contains [<i>Models</i>] sections for
5		several major or minor operating system
6		version numbers, Setup uses the section
7		with the highest version numbers that are
8		not higher than the operating system
9		version on which the installation is taking
10		place.
11	said metadata rules including at least	If the INF [<i>Models</i>] sections that match the
12	one rule specifying that information	operating system version also include
13	relating to at least one use or display of	product-type decorations, product suite
14	said content be recorded and/or	decorations, or both, then Setup selects the
15	reported.	section that most closely matches the
16		running operating system.
17		The AddService directive can set up event-
18		logging services for drivers.
19		INF AddService Directive
20		An AddService directive is used to control
21		how (and when) the services of particular
22		Windows 2000 or later device's drivers are
23		loaded, any dependencies on other
24		underlying legacy drivers or services, and
25		so forth. Optionally, this directive sets up
26		event-logging services by the
27		devices/drivers as well.
28		Relevant sections of the directive's entry
		include:
		<i>event-log-install-section</i> -- Optionally
		references an INF-writer-defined section in
		which event-logging services for this
		device (or devices) are set up.
		<i>EventLogType</i> -- Optionally specifies one
		of System , Security , or Application . If
		omitted, this defaults to System , which is
		almost always the appropriate value for the
		installation of device drivers. For example,
		an INF would specify Security only if the
		to-be-installed driver provides its own
		security support.
		<i>EventName</i> -- Optionally specifies a name
		to use for the event log. If omitted, this
		defaults to the given <i>ServiceName</i> .
26	35. A descriptive data structure as in claim	
27	34, in which:	
28	said first rights management data structure	The driver package is secured through a
	comprises a first secure container.	catalog file that is signed by Microsoft's
		Windows Hardware Quality Lab and

1		contains the hash of each file of the driver's package. The INF identifies the catalog file used to sign the driver package.
2		
3	36. A descriptive data structure as in claim 35, in which:	
4	said first secure container comprises:	The first secure container is the driver package secured by a catalog file.
5	said content; and	The content is the driver and related files within the signed driver package.
6	rules at least in part governing at least one use of said content.	The rules are within the INF, which is part of the signed driver package.
7		
8	37. A descriptive data structure as in claim 36, wherein the descriptive data structure is stored in said first secure container.	The INF is stored within the signed driver package.
9		
10	44. A descriptive data structure as in claim 34, further including:	
11	a representation of the format of data contained in a second rights management data structure,	The manufacture and models sections in the INF Version section are provided for the possibility of a single INF representing the format for multiple drivers.
12		Operating system version "decorating" relating the architecture, major and minor operating systems versions, product and suit information all relate to the target environment and is used to identify the files necessary for the target environment.
13		An INF file, such as in the case of operating system targeting, can be used for more than one driver package since it can contain more than one catalog file.
14		Further an INF can address the drives necessary for a multi-functional device.
15		
16		
17		
18		
19		
20	said second rights management data structure differing in at least one respect from said first rights management data structure.	The files of the second data structure would vary from the files on the first data structure.
21		
22		
23	45. A descriptive data structure as in claim 44, in which:	
24	said information regarding elements contained within said first rights management data structure includes information relating to the location of at least one such element.	INF specify where the driver files are located using the SourceDiskNames and SourceDiskFiles sections.
25		
26		
27	46. A descriptive data structure as in claim 44, further including:	
28	a first target data block including information relating to a first target	Operating system version "decorating" relating the architecture, major and minor

INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,920,861

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
58.	Product Infringing: Microsoft Reader SDK and Microsoft Digital Asset Server.
A method of creating a first secure container, said method including the following steps:	Method is carried out by Microsoft's Digital Asset Server and Microsoft's Litgen tools
(a) accessing a descriptive data structure, said descriptive data structure including or addressing	.opf file describing the file structure of a protected e-book including metadata, manifest, and "spine" information
(1) organization information at least in part describing a required or desired organization of a content section of said first secure container, and	Organization information regarding organization of the ebook and the inscription as specified in the manifest and spine information in the .opf file
(2) metadata information at least in part specifying at least one step required or desired in creation of said first secure container;	Metadata constitutes rules specifying the degree of security to use and/or XrML rules
(b) using said descriptive data structure to organize said first secure container contents	e-book packaging carried out by Microsoft Litgen tool
(c) using said metadata information to at least in part determine specific information required to be included in said first secure container contents; and	Step performed by Digital Asset Server; example of specific information is owner/purchaser information required in the inscription process
(d) generating or identifying at least one rule designed to control at least one aspect of access to or use of at least a portion of said first secure container contents.	Analyzing the metadata and finally packaging the e-book using a particular security level specified through the metadata
71. A method as in claim 58, in which:	
(a) said specific information required to be included includes information at least in part identifying at least one owner or creator of at least a portion of said first secure container contents.	Owner purchaser information required in the inscription process; XrML rule requiring display of copyright notice

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,920,861

58.	Product Infringing: All products that host the Microsoft Common Language Runtime or Compact Common Language Runtime.
A method of creating a first secure container, said method including the following steps;	Method is practiced by a user using the Common Language Runtime (CLR) or Compact Common Language Runtime (CCLR) to create a dynamic shared assembly or .NET Framework SDK to create a shared assembly
(a) accessing a descriptive data structure, said descriptive data structure including or addressing	.NET framework Assembly class and/or AssemblyBuilder class and/or AssemblyInfo file
(1) organization information at least in part describing a required or desired organization of a content section of said first secure container, and	This information is specified in the classes named above and in the AssemblyInfo file.
(2) metadata information at least in part specifying at least one step required or desired in creation of said first secure container;	This information is addressed in the classes and the AssemblyInfo file, e.g., for a shared assembly metadata will be specified that the assembly is to be signed using specified key
(b) using said descriptive data structure to organize said first secure container contents;	This step is carried out by applications and tools using the classes and assembly info file, including CLR (or CCLR) and .NET Framework SDK
(c) using said metadata information to at least in part determine specific information required to be included in said first secure container contents; and	This step is carried out by applications and tools using the assembly info file and classes that specify the metadata required in the target assembly
(d) generating or identifying at least one rule designed to control at least one aspect of access to or use of at least a portion of said first secure container contents.	User may specify rules, as specified in the .NET Framework SDK, to be placed in the assembly manifest including such rules requiring that all code be managed (CLR or CCLR compliant), "Code Access Security" permissions be supplied for use of code supplied in the assembly, etc
64. A method as in claim 58, in which:	
(a) said creation of said first secure container occurs at a first data processing arrangement located at a first site;	Can be a server, PC or workstation running CLR (or CCLR) to create a dynamic shared assembly or .NET Framework SDK to create a shared assembly)
(b) said first data processing arrangement including a communications port; and	Included in virtually any computer
(c) said method further includes:	
(1) prior to said step of accessing said descriptive data structure, said	Download of the assemblyinfo file and/or a file containing a class calling the

1	first data processing arrangement receiving said descriptive data structure from a second data processing arrangement located at a second site.	DefineDynamicAssembly methods or download of SDK containing assemblybuilder class from a second site
2		
3		
4	(d) said receipt occurring through said first data processing arrangement communications port.	Communications port is normally used for downloading
5		
6	67. A method as in claim 64, further comprising:	
7	at said first processing site, receiving said metadata through said communications port.	Download of the AssemblyInfo file and/or a file containing a class calling the DefineDynamicAssembly methods or download of SDK containing assemblybuilder class from a second site
8		
9	68. A method as in claim 67, in which,	
10	(a) said metadata is received separately from said descriptive data structure.	Method practiced when metadata names are addressed by the assembly class and a template for the AssemblyInfo file, and values corresponding to those names are received through a user interface such as provided by Microsoft Visual Studio or are provided from a separate file
11		
12		
13	71. A method as in claim 58, in which:	
14	(a) said specific information required to be included includes information at least in part identifying at least one owner or creator of at least a portion of said first secure container contents.	The Assembly class definition includes attributes for company name and trademark information, and these may be required attributes specified in the AssemblyInfo file
15		
16	72. A method as in claim 58, in which:	
17	(a) said specific information required to be included includes a copyright notice.	The Assembly class definition includes an attribute for copyright field that may be required by the AssemblyInfo file

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,920,861

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
58.	Product Infringing: Microsoft .NET Framework, Visual Studio .NET, and tools that include the Assembly Generator tool AL.exe.
A method of creating a first secure container, said method including the following steps;	The Assembly Generation tool generates a portable execution file with an assembly manifest from one or more files that are either Microsoft intermediate language (MSIL) modules or resource files. When using the tool's signing option, the assembly becomes a <i>secure container</i> .
(a) accessing a descriptive data structure, said descriptive data structure including or addressing	The <i>descriptive data structure</i> is the text file used as input by the Assembly Generation tool.
(1) organization information at least in part describing a required or desired organization of a content section of said first secure container, and	The DDS specifies the <i>link</i> and or <i>embed</i> directives to indicate which source files should be included in the assembly, how the included resource will be tagged, and if the resource will be private. Private resources are not visible to other assemblies. These tags are used to organize the assembly into <i>named</i> sections. Private attributes are used to organize the assembly into both public and <i>private</i> sections. (Public sections are the default.)
(2) metadata information at least in part specifying at least one step required or desired in creation of said first secure container;	The text file can contain "options" relating to how the assembly should be built and additional information that should be included. <i>Main</i> – Specifies the method to use as an entry point when converting a module to an executable file. <i>Algid</i> – Specifies an algorithm to hash all files. <i>Comp</i> – Specifies string for the Company field. <i>Conf</i> – Specifies string for Configuration field <i>Copy</i> – Specifies string for Copyright field. <i>Culture</i> – Specifies the culture string to associate with the assembly. <i>Delay</i> – Variation of this option specifies whether the assembly will be

	<p>fully or partially signed and whether the public key is placed in the assembly.</p> <p><i>Description</i> – Specifies the description field.</p> <p><i>Evidence</i> – Embeds file in the assembly with the resource name</p> <p><i>Security.Evidence</i>.</p> <p><i>Fileversion</i> – Specifies the file version of the assembly.</p> <p><i>Flags</i> – Specifies flags for such things as the assembly is side-by-side compatible, assembly cannot execute with other versions if either they are executing in the same application domain, process or computer.</p> <p><i>Keyf</i> – Specifies a file that contains a key or key pair to sign an assembly.</p> <p><i>Keyn</i> – Specifies the container that holds a key pair.</p> <p><i>Product</i> – Specifies string for Product field.</p> <p><i>Productv</i> – Specifies string for Product Version.</p> <p><i>Template</i> – Specifies the assembly from which to inherit all assembly metadata.</p> <p><i>Title</i> – Specifies string for Title field.</p> <p><i>Trade</i> – Specifies string for Trademark field.</p> <p><i>V</i> – Specifies version information.</p>
(b) using said descriptive data structure to organize said first secure container contents	<p>The following directives are used to specify which files are to be compiled into the assembly, how they will be tagged, and whether or not they will be visible to other assemblies, AKA private:</p> <p><i>Embed[name, private]</i> – copies the content of the file into the assembly and applies an optional name tag, and optional private attribute.</p> <p><i>Link[name, private]</i> – file becomes part of the assembly via a link and applies an optional name tag, and optional private attribute.</p>
(c) using said metadata information to at least in part determine specific information required to be included in said first secure container contents; and	<p>The following are some of the “options” address what information should be included in the secure container:</p> <p><i>Main</i> – Specifies the method to use as an entry point when converting a module to an executable file.</p> <p><i>Comp</i> – Specifies string for the Company field.</p> <p><i>Conf</i> – Specifies string for Configuration field</p> <p><i>Copy</i> – Specifies string for Copyright</p>

	<p>field.</p> <p><i>Culture</i> – Specifies the culture string to associate with the assembly.</p> <p><i>Description</i> – Specifies the description field.</p> <p><i>Evidence</i> – Embeds file in the assembly with the resource name.</p> <p><i>Security.Evidence</i>.</p> <p><i>Fileversion</i> – Specifies the file version of the assembly.</p> <p><i>Flags</i> – Specifies flags for such things as the assembly is side-by-side compatible, assembly cannot execute with other versions if either they are executing in the same application domain, process or computer.</p> <p><i>Keyf</i> – Specifies a file that contains a key or key pair to sign an assembly.</p> <p><i>Keyn</i> – Specifies the container that holds a key pair.</p> <p><i>Product</i> – Specifies string for Product field.</p> <p><i>Productv</i> – Specifies string for Product Version.</p> <p><i>Template</i> – Specifies the assembly from which to inherit all assembly metadata.</p> <p><i>Title</i> – Specifies string for Title field.</p> <p><i>Trade</i> – Specifies string for Trademark field.</p> <p><i>V</i> – Specifies version information.</p>
(d) generating or identifying at least one rule designed to control at least one aspect of access to or use of at least a portion of said first secure container contents.	User may specify rules, as specified in the .NET Framework SDK, to be placed in the assembly manifest including such rules requiring that all code be managed (CLR compliant), "Code Access Security" permissions be supplied for use of code supplied in the assembly, etc.
71. A method as in claim 58, in which:	
(a) said specific information required to be included includes information at least in part identifying at least one owner or creator of at least a portion of said first secure container contents.	<p>The following "options" specifies owner and creator information:</p> <p><i>Comp</i> – Specifies string for the Company field.</p> <p><i>Copy</i> – Specifies string for Copyright field.</p> <p><i>Trade</i> – Specifies string for Trademark field.</p>
72. A method as in claim 58, in which:	
(a) said specific information required to be included includes a copyright notice.	The copy "option" specifies the string for the for the Copyright field.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,982,891

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
1.	Products infringing: All products that include the Common Language Runtime or Compact Common Language Runtime or Common Language Infrastructure.
A method for using at least one resource processed in a secure operating environment at a first appliance, said method comprising:	Resource may constitute a Microsoft Windows process or hardware element; secure operating environment is Microsoft Common Language Runtime ("CLR") environment, Common Language Infrastructure ("CLI") or Compact CLR ("CCLR"); first appliance is computer running CLR, CLI or Compact CLR. Two infringing scenarios are set forth herein: (1) For CLR, an administrator, using the .NET framework, caspol.exe tool remotely configures security policy in a .NET configuration file for a machine, enterprise, user, or application and that security policy interacts with rules or evidence declared in a shared assembly provided by another entity ("1 st scenario"); and (2) for CLR, CLI and CCLR two assemblies are delivered to an appliance; the first assembly has a rule that demands permissions from a caller in the second assembly, and the second assembly includes a control that asserts such permissions or provides evidence that convinces the runtime that it has such permissions. ("2 nd scenario"). In each scenario Microsoft .NET "Code Access Security" framework or "Role Based Security" framework is used.
(a) securely receiving a first entity's control at said first appliance, said first entity being located remotely from said operating environment and said first appliance;	1 st scenario: first entity is the administrator, and the policy that constitutes this entity's control is securely received at the first appliance through a session established between the administrator's computer and the first appliance, requiring security credentials such as the administrator's login and password or other secure session means. 2 nd scenario: first entity is creator or distributor of the first assembly, assembly manifest includes a control demanding or refusing or otherwise asserting a security action on permissions from a caller; first assembly is integrity-checked.
(b) securely receiving a second entity's control at said first appliance, said second entity being located remotely from said operating environment and said first appliance, said second entity being different from said first	Second entity's control is contained in shared assembly manifest (and therefore integrity protected) that provides evidence for obtaining permissions, or asserts permissions; assembly creator/distributor is located remotely and is

1	entity; and	not the administrator (1 st scenario) or creator/distributor of the first container (2 nd scenario);
2		
3	(c) securely processing a data item at said first appliance, using at least one resource,	Secure processing is carried out by CLR, CLI or CCLR. Data item constitutes an executable code element, an interface controlled by such an executable, a data collection or stream (such as media file or stream or text file) or an environment variable. CLR, CLI or CCLR securely processes the rules, which will in both scenarios govern access to methods and data from the first assembly. The resource named in the claim is, e.g., a Windows process that is established by the runtime or hardware element on the computer.
4	including securely applying, at said first appliance through use of said at least one resource said first entity's control and said second entity's control to govern use of said data item.	
5		
6		
7		
8		
9	51. A method as in claim 1 wherein at least said secure processing step is performed at an end user electronic appliance;	Consumer computer or appliance running Microsoft CLR, CLI or CCLR).
10		
11	58. A method as in claim 1 wherein the step of securely receiving a first entity's control comprises securely receiving said first entity's control from a remote location over a telecommunications link, and the step of securely receiving said second entity's control comprises securely receiving said second entity's control from the same or different remote location over the same or different telecommunications link.	1 st scenario 1: link is LAN or WAN; 2 nd scenario: link is any telecommunications link, including the internet.
12		
13		
14		
15		
16		
17	65. A method as in claim 1 wherein the processing step includes processing said first and second controls within the same secure processing environment.	Secure processing environment is CLR, CLI or CCLR running on user's computer or appliance.
18		
19	71. A method as in claim 1 further including the step of securely combining said first entity's control and said second entity's control to provide a combined control arrangement.	In scenario 2, arrangement consists of the stack frame, and the corresponding array of permission grants for assemblies on the stack, and the permission demanded by the first assembly. Secure combining performed by the CLR, CLI or CCLR.
20		
21		
22	76. A method as in claim 1 wherein said two securely receiving steps are independently performed at different times.	Steps are performed at different times in both scenarios.
23		
24	84. A method as in claim 1 wherein at least one of the first entity's control and the second entity's control comprises at least one executable component and at least one data component.	In both scenarios the second entity supplies an assembly with a demand procedure executed by the CLR, CLI or CCLR. The data component is a specific attribute value referenced by the assembly.
25		
26	89. A method as in claim 1 wherein said first appliance includes a protected processing environment, and wherein:	Microsoft Common Language Runtime (CLR), Common Language Infrastructure (CLI), or Compact Common Language Runtime (CCLR) environment.
27		
28	(a) said method further comprises a step of receiving, at said first appliance, said data item	Typically occurs in both scenarios.

separately and at a different time from said receiving said first entity's control ; and	
(b) said securely processing step is performed at least in part in said protected processing environment	Protected processing environment is the CLR, CLI or CCLR.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,982,891

22.	Infringing products include Office 2003 and included applications, and Server 2003, including Microsoft hosted RMS Service using Passport
A method of securely controlling use by a third party of at least one protected operation with respect to a data item comprising:	<p>A user (third party) accesses an IRM-protected data item governed by IRM controls under two or more RMS servers. For example, the data item may be a IRM-protected document.</p> <p>The IRM controls may be associated with the data item directly or via a IRM-protected container holding the IRM-protected data item, such as an IRM-protected email with the IRM-protected document attached.</p>
(a) supplying at least a first control from a first party to said third party;	The user acquires a first use license from a first RMS server (first party) enabling access to, the IRM-protected data item under the IRM rules associated with the first RMS server. For example: (1) the first use license from the first RMS server permits the user to access a IRM-protected document contained within or attached to an IRM-protected email; or (2) the first use license from the first RMS server applies a first set of IRM rules to an IRM-protected document.
(b) supplying, to said third party, at least a second control from a second party different from said first party;	The user acquires a second use license from a second RMS server (second party) enabling access to the IRM-protected data item under the IRM rules associated with the second RMS server. For example: (1) in addition to the user being given access to an IRM-protected email based on a first use license, a second RMS server provides a second use license enabling access to the IRM-protected document attached thereto; or (2) the second use license from the second RMS server applies a second set of IRM rules to the IRM-protected document.
(c) securely combining at said third party's location, said first and second controls to form a control arrangement;	The first and second use licenses are combined to form a control arrangement that governs access to the IRM-protected data item.
(d) securely requiring use of said control arrangement in order to perform at least one protected operation using said data item; and	The combined first and second use licenses govern access to the IRM-protected data item.
(e) securely performing said at least one protected operation on behalf of said third party with respect to said data item by at least in part employing said control arrangement	The user performs a protected operation (e.g., read, print, edit) on the IRM-protected data item. The combined first and second use licenses are employed to permit the protected operation.

23. A method as in claim 22 wherein said data item is protected.	The data item is encrypted and protected by IRM.
39. A method as in claim 22 further including securely and persistently associating at least one of: (a) said first control, (b) said second control, and (c) said control arrangement, with said data item.	The first and/or second use license are securely and persistently associated with the IRM-protected data item.
53. A method as in claim 22 wherein at least two of the recited steps are performed at an end user electronic appliance.	Steps performed at a user's computer or appliance.
60. A method as in claim 22 wherein step (a) comprises supplying said first control from at least one remote location over a telecommunications link, and step (b) comprises supplying said second control from the same or different remote location over the same or different telecommunications link.	The first and second use licenses are received over a telecommunications link such as a networking or modem/serial interface.
67. A method as in claim 22 wherein at least step (c) is performed within the same secure processing environment at said third party's location.	Steps are performed at user's computer or appliance.
91. A method as in claim 22 wherein:	
(a) said method further comprises supplying said data item to said third party separately and at a different time from supplying of said first control to said third party; and	The first use license (first control) is received at the time that the user accesses the data item, which occurs separately and at a different time from receipt of the IRM-protected data item itself.
(b) said securely performing step comprises performing said protected operation at least in part in a protected processing environment.	The protected operations require decryption of the protected content, which is done inside the RM lockbox. The RM lockbox is protected by mechanisms such as obfuscation, anti-debugging, and tamper resistance.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,982,891

26.	Products infringing: Visual Studio.NET, .NET Framework SDK, and all products that include the Common Language Runtime or Compact Common Language Runtime or Common Language Infrastructure.
A secure method for combining data items into a composite data item comprising:	
(a) securely providing, from a first location to a second location, a first data item having at least a first control associated therewith;	A first signed and licensed .NET component, .NET assembly, managed control and/or Web control (component) is the first data item. The first .NET component developer (first location) provides the application assembly developer (second location) the first component. The first control is the set of declarative statements comprising the LicenseProviderAttribute (alternately referred to as license controls).
(b) securely providing, from a third location to said second location, a second data item having at least a second control associated therewith;	A second signed and licensed component is the second data item. The second component developer (third location) provides the application assembly developer (second location) the second component. The second control is the set of declarative statements comprising the LicenseProviderAttribute.
(c) forming, at said second location, a composite of said first and second data items;	The application assembly developer will include at least the two components into its assembly.
(d) securely combining, at said second location, said first and second controls to form a control arrangement; and	At the second location, the application assembly developer uses the .NET runtime that includes the LicenseManager. Whenever a component is instantiated (here, an instance of the first licensed component), the license manager accesses the proper validation mechanism for the component. The license controls (first control) for the runtime license (derived from the design time license) are bound into the header of the .NET application assembly, along with the second control for the second component. Visual Studio.NET securely handles the creation of runtime license controls. Runtime licenses are embedded into (and bound to) the executing application assembly. The license control attribute

1		included in the first component is customized in the second location to express and require the runtime license. In a more advanced scenario, the License Compiler tool can be used to create a ".licenses file" containing licenses for multiple components, including runtime licenses for components and classes created by the license provider. This .licenses file is embedded into the assembly.
2		
3		
4		
5		
6		
7		The third control set comprises the runtime license controls for the first and second components (that had been bound to the assembly), the declarative controls provided by the application assembly developer, and any runtime licenses for other components included by the developer in application assembly. The controls are typically integrated into the header of the .NET application assembly calling the first licensed component.
8		
9		
10		
11		
12	(e) performing at least one operation on said composite of said first and second data items based at least in part on said control arrangement.	The proper execution of the application will require that the assembly have run time licenses for the two components.
13		
14		
15	27. A method as in claim 26 wherein said combining step includes preserving each of said first and second controls in said composite set.	The set of declarative statements comprising the LicenseProviderAttribute of both the first and second components are included in the application assembly.
16		
17		
18	28. A method as in claim 26 wherein said performing step comprises governing the operation on said composite of said first and second data items in accordance with said first control and said second control.	The application will require the first and second controls to operate properly when it calls the first and second data items, respectively.
19		
20		
21	29. A method as in claim 26 wherein said providing step includes ensuring the integrity of said association between said first controls and said first data item is maintained during at least one of transmission, storage and processing of said first data item.	Signing the component that has embedded within it the license control ensures the integrity of the association of the control and data item.
22		
23		
24		
25	31. A method as in claim 26 wherein said providing step comprises codelivering said first data item and said first control.	The component includes the license control and therefore they are codelivered.
26		
27	40. A method as in claim 26 further including the step of securely ensuring that at least one of (a) said first control, (b) said second control, and (c) said control arrangement, is persistently associated with	Each component includes the license control. Signing the component that has embedded within it the license control ensures the persistence of the association of the control and data item.
28		

1	at least one of said first and second data	
2	items.	
3	54. A method as in claim 26 wherein at	At least step (e) is typically performed at an
4	least one of steps (c), (d) and (e) is	end-user electronic appliance.
5	performed at an end user electronic	
6	appliance.	
7	61. A method as in claim 26 wherein step	Microsoft maintains Web sites where a
8	(a) comprises providing said first data item	developer can get components over the
9	from at least one remote location over a	Web. These sites include references
10	telecommunications link, and step (b)	whereby a developer may obtain
11	comprises providing said second data item	components through their Web connection.

26	component.	

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,982,891

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
35	Infringing products include: Windows Media Player, Individualized DRM Clients and the Secure Audio Path (SAP) technology.
A method for using at least one resource processed by a secure operating environment, said method comprising:	
securely receiving a first load module provided by a first entity external to said operating environment	The Individualized DRM Client (first load module) is a signed security upgrade DLL. It is also bound to the hardware ID of the machine on which it runs. It is therefore <u>securely delivered and integrity protected</u> :
securely receiving a second load module provided by a second entity external to said operating environment, said second entity being different from said first entity; and	A SAP certified driver is also signed and carries with it a certificate that indicates its compliance with SAP criteria. If it is delivered to a PC it is secure in the sense that it is integrity protected. This driver would not come from the same entity as the Individualization DLL.
securely processing, using at least one resource, a data item associated with said first and second load modules, including securely applying said first and second load modules to manage use of said data item.	If a WM audio file targeted to the Individualized DRM client carries with it a requirement that SAP be supported to render the WMF contents, the content is processed for playing through a soundcard using the WMP and by applying the DRM client - which decrypts the content and negotiates with the DRM kernel processing of the content through a Secure Audio Path that includes the SAP-certified audio driver.
56. A method as in claim 35 wherein at least two of the recited steps are performed at an end user electronic appliance.	All steps occur at the user's PC that supports the WMP and DRM client and SAP.
63. A method as in claim 35 wherein said first load module receiving step comprises securely receiving said first load module from at least one remote location over at least one telecommunications link, and said second load module receiving step comprises securely receiving said second load module from the same or different remote location over the same or different telecommunications link.	The Driver and DRM client are received from distinct locations and may be delivered securely over the Internet. They are delivered securely in that each is integrity protected.
70. A method as in claim 35 wherein said securely processing step comprises securely executing said first and second	Both load modules are executed on the PC within the WMP/DRM Client/SAP environment.

1	CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
2	load modules within the same secure processing environment.	
3		
4	74. A method as in claim 35 further including securely combining said first and second load modules to provide a combined executable.	Since both the DRM client and the driver are DLLs in the same audio rendering chain, they exist as an execution environment.
5		
6	81. A method as in claim 35 wherein said securely receiving steps are performed independently at different times.	The driver and Individualization DLL need not be received at the same time.
7		
8	94. A method as in claim 35 wherein said secure operating environment includes a protected processing environment, and wherein:	The Windows Media Player together with the Individualized DRM Client and Secure Audio Path comprise a protected environment for processing protected media. The protected Windows Media Files are received after the load modules have been received and installed (licenses cannot be acquired until load modules are in place). The processing of the Windows Media File occurs in the protected environment.
9	said method further comprises receiving a data item within said secure operating environment;	
10	said first load module receiving step is performed separately and at a time different from receiving said data item; and	
11	said securely processing step is performed at least in part in said protected processing environment.	
12		
13		
14		
15		
16		

17 Examples of SAP-certified drivers include - as indicated at

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,982,891

36.	Product Infringing: Any product using Common Language Runtime (CLR), Common Language Infrastructure (CLI), or Compact Common Language Runtime (CCLR)
A secure operating environment system for managing at least one resource comprising:	Microsoft CLR, CLI or CCLR (operating environment system), managing any of the resources on a typical computer, including memory, files system, communications ports, storage devices, and higher level resources that may use any of these or combinations of them:
(a) a communications arrangement	Communications port and Microsoft Internet Protocol stack that may optionally use Secure Socket Layer protocol or IPSEC packet security protocol, supplied with Microsoft Windows.
(1) that securely receives a first control of a first entity external to said operating environment, and	Rule or evidence contained in the manifest of a shared assembly, distributed by a first entity that can be used by the CLR, CLI or CCLR to determine permissions that may be needed to cause operations on a data item or resource controlled by another entity; shared assembly is tamper-protected and may be received using secure SSL or IPSEC protocol.
(2) securely receives a second control of a second entity external to said operating environment, said second entity being different from said first entity; and	Rule specified in the manifest of a second shared (Tamper protected) assembly, that demands permissions of callers of its methods.
(b) a protected processing environment, operatively connected to said communications arrangement, that:	CLR, CLI or CCLR, connected to (e.g.) communications port
(1) [] securely processes, using at least one resource, a data item logically associated with said first and second controls, and	CLR, CLI or CCLR uses type safety mechanisms, access controls, integrity detection, and separation of domains. Data item may be any data item that is managed by the second assembly, which may be a member of such assembly, and whose state or value may be accessible through an interface to other assemblies, and which is referenced by the first assembly.
(2) [] securely applies said first and second controls to manage said resource for controlling use of said data item.	CLR, CLI or CCLR processes the demand for permissions from the second assembly, collects the evidence or processes the rule from the first assembly, and determines whether the first assembly has the permissions to use the resource to operate on the data item controlled by the second assembly.
57. A system as in claim 36 wherein said protected processing environment is part of an	Computer or electronic appliance running CLR, CLI or CCLR

end user electronic appliance.	
64. A system as in claim 36 wherein said communications arrangement receives said first and second controls from at least one remote location over at least one telecommunications link.	Shared assemblies are designed to be received remotely, e.g., over the internet.
75. A system as in claim 36 wherein said protected processing environment combines said first and second controls to provide a combined control arrangement.	Arrangement consists of the stack frame and and the corresponding array of permission grants for assemblies on the stack, and the permission demanded by the second assembly.
82. A system as in claim 36 wherein said communications arrangement independently receives said first and second controls at different times	Assemblies, including controls, are designed for independent delivery.
88. A system as in claim 36 wherein at least one of the first control and second controls comprises at least one executable component and at least one data component.	The second entity supplies an assembly with a demand procedure (executed by the CLR, CLI or CCLR) that includes reference to a specific attribute value (the data component), and the protected processing environment executes the executable component (demand) in a manner that is at least in part responsive to the data component (execution is in response to the security action supplied in the data item).

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,982,891

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
36.	Infringing Product: My Services
A secure operating environment system for managing at least one resource comprising:	Secure operating environment is the secure server for any .NET My Services service (e.g. My Calendar, My Inbox)
a communications arrangement that securely receives	Secure server receives communications formatted using the SOAP-SEC, the security extension to SOAP that is used by My Service servers to receive controls.
a first control	The first control is a roleTemplate associated with the service. The roleTemplate identifies specific actions (e.g. read, replace) that can be performed against a certain scope (resource or set of resources).
of a first entity external to said operating environment,	The first entity is the administrator of the server database, or other entity with authority over its content that sets up the roleTemplates and scopes. That entity is independent from and located remotely from the secure server.
and securely receives a second control	A role element specified by a specific end user, which is securely received by the secure server using the SOAP-SEC protocol.
of a second entity external to said operating environment, said second entity being different from said first entity;	The end user is located remotely from the secure server.
and a protected processing environment, operatively connected to said communications arrangement, that:	The protected processing environment is the .NET security service (authorization system) operating within the server. The server uses the SOAP-SEC communication protocol to receive controls.
(a) securely processes, using at least one resource, a data item logically associated with said first and second controls, and	"Securely processes" is performing the requested operation on secure server running .NET. The system will perform the requested operation ensuring that the user has no access to information outside the

1		scope computed.
2		The resource is the server software and/or
3		hardware used to process the two controls
4		and user data.
5		The first control is the roleTemplate for the
6		service. The second control is the role
7		element for an individual user.
8		The data item is the end user's stored
9		content (e.g. calendar, email inbox, etc.).
10	(b) securely applies said first and second	The secure server determines the result
11	controls to manage said resource for	scope (visible node set) for the operation
12	controlling use of said data item.	that is computed from the role element and
13		the roleTemplate. That result scope is used
14		to manage the data item.

"SIM Level: 1 = Restricted

Description: Only properly certified CEI (WCEfA device installation) files can be installed on the device. Remote execution is restricted to executables with master key.

Key: Logo certified CEI file required. CEI files or EXEs with master keys permitted." (F, pg.1)

"The kernel loader calls it each time a module is loaded by Windows CE. It returns one of the following values that determine the module's access to kernel resources:

Value

Meaning

OEM_CERTIFY_TRUST (2)

The module is trusted by the OEM to perform any operation.

OEM_CERTIFY_RUN (1)

The module is trusted by the OEM to run but is restricted from making certain function calls.

OEM_CERTIFY_FALSE (0)

The module is not allowed to run.

"(H, pg. 1)

Digitally signing: "Before the kernel loads a file, it uses the OEMCertifyModule function to verify that the file contains the proper signature." (N, pg.1)

"Signfile.exe: This tool signs an executable with a supplied private key. You can use the following command parameters with this tool....-s AttribString, specifies an optional attribute string to be included in the signature. For example, you could add a string to indicate the trust level of the application." (O. Pg. 1)

In the MSDN article Verifying the Signature, the sample code segment states

"//the file has a valid signature

//we expect the trust level to be returned as signed data...

//case 'R' : dwTrustLevel = OEM_CERTIFY_RUN" (N, pg.2)

"The WCEfA Security Layer isolates installed applications from making unrestricted kernel and WCEfA API calls. This allows the OEM to assign one of three levels of security to applications and drivers installed in RAM when they are loaded into the system. The three levels are Trusted...,Restricted..., and Blocked...On the systems level, the WCEfA Security

layer fits between ISV applications and isolates these software modules from having free access to all WinCE kernel calls and WCEfA middleware APIs." (I, pg. 1)

The developer submits their application for certification. If it passes, then the .cei file (a form of cab file) receives a certification key from the certifier. The signed PE is within this .cei file.

(b) digitally signing a second load module with a second digital signature different from the first digital signature, the second digital signature designating the second load module for use by a second device class having at least one of tamper resistance and security level different from the at least one of tamper resistance and security level of the first device class;

A *second load module* is a WCEfA software component is a signed PE file. The *second device class* with a different tamper resistance or security level is a device that is "Closed", that is, it will not allow third party to software to be installed. A closed device only allows trusted software to run. The Security Layer setting of "Trusted" allows the Microsoft and OEM software full access to kernel and middleware APIs.

In the MSDN article Verifying the Signature, the sample code segment states

```
//the file has a valid signature
// we expect the trust level to be returned as signed data...
//case 'T' : dwTrustLevel = OEM_CERTIFY_TRUST"
```

(N, pg.2)

"Signfile.exe: This tool signs an executable with a supplied private key. You can use the following command parameters with this tool....-s AttribString, specifies an optional attribute string to be included in the signature. For example, you could add a string to indicate the trust level of the application. (O. Pg. 1)

"SIM Level: 2 = Closed
Description: Platform is limited to software supplied directly by OEM or Microsoft. Third-party applications cannot be installed. ...
Key: Master key required for any install or remote execution." (F, pg.1)

Related to the Security Layer, the Trusted level "is most likely reserved for MS and OEM applications and drivers." (I, pg. 1)

Whereas the .cei files for certified software have a certification key (sometimes call MS Logo key), the .cei files from Microsoft or the OEM have a master key attached. ""Master key required for any install or remote execution." (F, p.g1)

(c) distributing the first load module for use by at least one device in the first device class; and

First load module is the certified software from a third party that will be run as part of the "Restricted" *first device class*.

"Once your application is complete, send the .cei file to

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,157,721

5.	Product infringing: Windows Hardware Quality Lab certification services, and operating system products that support driver signature technology.
A software verifying method comprising:	<p>Microsoft encourages manufacturers to have their device drivers tested and signed. For example, only signed drivers will ship "in-the-box." Also, Microsoft's driver ranking prefers signed drivers to unsigned drivers.</p> <p><u>Microsoft Web Page -- Can't Find a Test Category for Your Driver?</u></p> <p>WHQL's long-term objective is to be able to digitally sign all drivers. Although we do not currently have test programs for certain driver types, such as specialized device drivers and software filter drivers, WHQL is investigating a long term solution to expand the categories of drivers tested under Windows 2000 and ultimately all Windows operating systems. We are already formulating a test program for anti-virus file system filters, and plan to address other file system filter drivers as soon as the initial program is in place.</p>
(a) testing a load module	<p>The driver will be tested for each version of the operating system it supports and against the device class specification that apply to the device's class.</p> <p>The driver package is a load module. A driver package contains one or more of the following files: A device setup information file (INF file) A driver catalog (.cat) file One or more optional co-installers</p> <p>Microsoft operates the Window Hardware Quality Lab, which tests drivers submitted by driver manufactures.</p> <p>The manufacturer can test their own driver using the Microsoft testing kit and submit the test results to WHQL when requesting a signature. Additionally, Microsoft or a testing facility working with Microsoft can perform the testing.</p>
having at least one specification associated	The manufacturer-written INF file, which

1	therewith,	is part of the driver package, is a
2		specification. Microsoft Windows drivers
3		must have an INF file in order to be
4	the specification describing one or more	installed.
5	functions performed by the load module;	The INF Version section specifies its
6		device class. One use of the device class
7		is to identify the specific Windows
8		compatibility specification that relate to the
9		device class. These specifications will vary
10		by device class in part because the function
11		of each device can vary among class. The
12		INF incorporates by reference the
13		Microsoft supplied device class-specific
14		specification by identifying its class in the
15		INF.
16		The INF can include operating system
17		"decorating" to specify the operating
18		system architecture, major and minor
19		version, product and suite the driver is
20		intended for and can further use this
21		decorating to specify what operating
22		systems for which it is not intended.
23		Because the functionality of each of the
24		operating systems may vary the driver must
25		be tested for each applicable operating
26		system.
27		<u>Qualification Service Policy Guide –</u>
28	(b) verifying that the load module satisfies	<u>Hardware Category Policies</u>
	the specification; and	You must select the correct hardware
		category for your device. If you select the
		wrong hardware category for your device,
		your submission will fail. For example, if
		you have a storage/hard drive device, but
		you select storage/tape drive as your
		hardware category, your submission will
		fail.
		Windows XP HCT 10.0 Q & A – Windows
		XP Logos
		Q: Which "Designed for Windows XP"
		logos are available for my product?
		A: Devices and systems qualify for a
		"Designed for Windows" logo after passing
		testing with the appropriate WHQL test kit
		on all operating systems specified by the
		logo. "Designed for Windows" Logos for Device
		and System Programs lists which logos are
		available for each type of product.
		The Microsoft WindowsXP Hardware
		Compatibility Test (HCT) kit version 10.0
		includes the tests, test documentation, and

	<p>submission processes that are required to participate in the Microsoft Windows Logo Program for Hardware for the Windows XP Professional operating system. To qualify to use the "Designed for Windows" logo for hardware, products must pass testing with the Microsoft Windows HCT kit. The HCT kits are organized by hardware type.</p> <p>As mentioned above, the manufacturer can test their own driver using the Microsoft testing kit and submit the test results to WHQL when requesting a signature. Additionally, Microsoft or a testing facility working with Microsoft can perform the testing.</p>
(c) issuing at least one digital certificate attesting to the results of the verifying step.	<p>When a driver package passes WHQL testing, WHQL generates a separate CAT file containing a hash of the driver binaries and other relevant information. WHQL then digitally signs the CAT file using Digital Signature cryptographic technology and sends it to the vendor. Driver signing does not change the driver binaries or the INF file submitted for testing.</p> <p>Microsoft uses digital signatures for device drivers to let users know that drivers are compatible with Microsoft Windows XP, Windows 2000, and Windows Me. A driver's digital signature indicates that the driver was tested with Windows for compatibility and has not been altered since testing.</p>

a first apparatus including, user controls, a communications port, a processor, a memory storing:	A device with user controls, a communications port, a processor, and memory. For example, the user controls may be a keyboard and mouse, the communications port may be a NIC card with an Ethernet port, the processor may be a CPU, and the memory may be a hard-drive or RAM.
a first secure container containing a governed item, the first secure container governed item being at least in part encrypted; the first secure container having been received from a second apparatus;	The first secure container is an encrypted IRM-protected document. This encrypted IRM-governed document is, for example, received from a remote computer, as an attachment to an IRM-governed email or downloaded from a document server or web site.
a first secure container rule at least in part governing an aspect of access to or use of said first secure container governed item, the first secure container rule, the first secure container rule having been received from a third apparatus different from said second apparatus; and	The first secure container rule is received from the RMS server in the form of a use license. This use license contains rules generated by the RMS server specifically for the user (or user's group).
hardware or software used for receiving and opening secure containers, said secure containers each including the capacity to contain a governed item, a secure container rule being associated with each of said secure containers;	The RM-enabled device contains hardware or software for receiving and opening secure documents. The secure documents have the capacity to contain IRM-governed content, with a rule being associated with each secure document. The rules associated with said secure documents are the rules that come as part of the originally received document as well as rules that come back from the RMS server.
a protected processing environment at least in part protecting information contained in said protected processing environment from tampering by a user of said first apparatus,	Protected information on the RM-enabled device is protected by the use of at least cryptographic technique. The rule governing the document works

FOR U.S. PATENT NO. 6,185,683

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
56.	Infringing products include Office 2003 and included applications, and Server 2003, including Microsoft hosted RMS Service using Passport
A method of securely delivering an item, including the following steps:	
performing an authentication step;	The RM-enabled application, e.g., Word, OUTLOOK, PowerPoint, etc., must be authenticated before it is allowed access to or use of the content.
associating a digital signature with said item;	The RM protected content is signed.
incorporating said item into a first secure electronic container, said item being at least in part encrypted while in said container, said incorporation occurring in an apparatus containing a first protected processing environment, said protected processing environment at least in part protecting information contained in said protected processing environment from tampering by a user of said apparatus;	RM-protected content is packaged with rules and encrypted. Protected information on the RM enabled computer is protected by the use of at least cryptographic techniques.
in said protected processing environment, associating a first rule with said first secure electronic container, said first rule at least in part governing at least one aspect of access to or use of said item;	The IRM-protected document (said item) has an associated rule or rules.
authenticating an intended recipient of said item;	A recipient of IRM-protected content must be authenticated before being allowed access to or use of the content.
transmitting said first secure electronic container and said first rule to said intended recipient; and	The document is sent via IRM-protected email as an attachment.
using a second protected processing environment, providing said intended recipient access to at least a portion of said item,	The email is received at another IRM-enabled computer.
said access being governed at least in part by said first rule and by a second rule present at said intended recipient's site.	The first said rule is the rule(s) associated with the attached document, and the second rule is the rule(s) received that govern the email itself.

INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,185,683

126.	Product Infringing: Windows Hardware Quality Labs Authentication services, Windows operating Systems (such as Windows XP) that support the driver signing features, and any product using Driver Signing feature
A method of providing trusted intermediary services including the following steps:	
at a first apparatus, receiving an item from a second apparatus;	Microsoft's Window Hardware Quality Labs (WHQL) (first apparatus) receiving driver package (item) from independent hardware vendor (IHV) or any driver developer (second apparatus).
associating authentication information with said item;	The signature information of a security catalog file (see next element of claim) names Microsoft as the publisher. WHQL's signature is intended to signify that a driver has complied with Microsoft's Windows compatibility and/or Secure Audio Path (SAP) specifications.
incorporating said item into a secure digital container;	The hashes of the files making up the driver package are included in the signed security catalog file for the driver package. The catalog file makes the driver package a secure digital container.
associating a first rule with said secure digital container, said first rule at least in part governing at least one aspect of access to or use of said item;	Driver developers specify rules in an INF file that govern the installation and/or use of the driver. For example, as specified in the INF, the installation events will vary based on the user's operating system version, which includes architecture, product type and suite. The INF logging rules and can further specify security rules that are evaluated when the driver is used. White Paper – Operating-System Versioning for Drivers under Windows XP Setup selects the [Models] section to use based on the following rules: If the INF contains [Models] sections for several major or minor operating system version numbers, Setup uses the section with the highest version numbers that are not higher than the operating system version on which the installation is taking place.

21
22
23
24
25
26
27
28

If the INF [Models] sections that match the operating system version also include product type decorations, product suite decorations, or both, then Setup selects the section that most closely matches the running operating system.

Suppose, for example, Setup is running on Windows XP Professional (which is operating system version 5.1), and it finds the following entry in a [Manufacturer] section:

%FooCorp%=FooMfg, NT, NT.5, NT.5.5, NT....0x80

In this case, Setup will look for a [Models] section named [FooMfg.NT.5]. Setup will also use the [FooMfg.NT.5] section if it is running on a Datacenter version of Windows .NET Server, because a specific major/minor version takes precedence over the product type and suite mask.

For example, to create an INF that is intended for use only on Windows XP, the INF file could contain the following:

[Manufacturer]
"Foo Corp." = FooMfg, NT.5.1, NT.5.2
[FooMfg.NT.5.1]
"Foo Device" = FooDev, *FOO1234

Note the omission of the undecorated [FooMfg] section, as well as the omission of the [FooMfg.NT.5.2] section. This INF file would appear to be "empty" on any operating system other than Windows XP.

Access Control List Rules

XP DDK – Tightening File-Open Security in a Device INF File

For Microsoft Windows 2000 and later, Microsoft tightened file-open security in the class installer INFs for certain device classes, including CDROM, DiskDrive, FDC, FloppyDisk, HDC, and SCSIAdapter.

If you are unsure whether the class installer for your device has tightened security on file opens, you should tighten security by using the device's INF file to assign a value to the DeviceCharacteristics value name in the registry. Do this within an add-

1		registry-section, which is specified using the INF AddReg directive.
2	transmitting said secure digital container	Microsoft, IHV, driver developer or any other party distributing signed driver packages transmitting the driver package to user (third apparatus). Since the driver package includes the INF file, it will include the first rule. The protected processing environment (PPE) is Windows operating system with its pertinent services such as Windows File Protection, signature and cryptographic functions, Plug and Play and Set-up and their related default and modifiable policies. The PPE checks for signatures on driver packages and detects situations when the driver package's signature does not match the driver package.
3	and said first rule to a third apparatus, said	
4	third apparatus including a protected	
5	processing environment at least in part	
6	protecting information stored in said	
7	protected processing environment from	
8	tampering by a user of said third apparatus;	
9		
10		
11		
12		Additionally, the Digital Rights Manager (DRM) components (kernel and client) will contribute to making the third apparatus a PPE when the SAP functionality is invoked. [That is, when SAP is required, an additional signature is checked to verify that the driver is SAP compliant and that it hasn't been tampered with.]
13		
14		
15	said third apparatus receiving said secure digital container and said first rule;	The end-user receiving the driver package.
16	said third apparatus checking said authentication information; and	<p>A step in the Plug and Play/Setup driver installation process checks signature at installation. Additionally, the DRM component will check the DRM signature when invoking DRM functionality.</p> <p><u>White Paper – Driver Signing for Windows</u></p> <p>During driver installation, Windows compares the hashes contained in the driver's CAT file with the computed hash of the driver binaries to determine whether the binaries have changed since the CAT file was created. If a driver fails the signature check or there is no CAT file, what happens next depends on the driver signing policy in effect on the user's system:</p> <p>If the policy is set to Ignore, the driver installs silently, with no message to the user.</p> <p>If the policy is set to Warn, a message warns the user the driver is unsigned, which means that it has not passed WHQL</p>
17		
18		
19		
20		
21		
22		
23		
24		
25		
26		
27		
28		

1		testing and might cause problems. The Warn dialog box gives an administrative user the option to override the warning and install an unsigned driver anyway.
2		
3		
4		If the policy is set to Block, the system displays a message that informs the user that the driver cannot be installed because it is not digitally signed.
5		
6	said third apparatus performing at least one action on said item, said at least one action being governed, at least in part, by said first rule and by a second rule resident at said third apparatus prior to said receipt of said secure digital container and said first rule, said action governance occurring at least in part in said protected processing environment.	The action would be installing and/or using the driver. For example, installation policies govern the actions (ignore, warn or block) taken based on whether a driver is signed or not and these policies (rule) are resident on the third apparatus. Another rule is the "ranking" of available drivers when selecting a driver to install. This ranking process includes whether a driver is signed or not. Another rule is the security access rules that the class installer that will be used to install the device has.
7		
8		
9		
10		
11		
12		In the case of DRM, the content will have associated rules governing its use in a SAP-complaint environment. These rules (the content license) can be resident at the third apparatus particularly in the case when a user is installing a new (SAP-compliant) device that will render previously acquired content or in the case that acquired content cannot be rendered until the user installs required drivers.
13		
14		
15		
16		
17		
18		For example, when installing:
19		The XP driver ranking process and the modifiable default related to signature state of the driver act as the second rule.
20		
21		The driver will be installed only if the first and second rules validate.
22		
23		<u>Operating-System Versioning for Drivers under Windows XP</u>
24		<i>Default System Policy for Unsigned Drivers</i>
25		
26		If the user installs an unsigned driver for a designated device class from disk or from another web site, Windows XP/Windows 2000 displays a warning that the driver is unsigned, thus helping to preserve the integrity of the released system. However, by default, Windows XP/Windows 2000
27		
28		

1		does not block installation of unsigned drivers, so vendors can get urgent hot-fixes to customers while waiting for WHQL to test the fix.
2		
3		
4		In Windows XP, the default driver signing policy can be changed through the
5		Hardware tab of the System applet on the Control Panel. A user can change the
6		policy to be more restrictive, but not less
7		restrictive on a per-user basis (that is, a user can change Warn to Block, but not to Ignore). An administrator can change the
8		policy to be either more restrictive or less
9		restrictive for all users on the system by checking "Apply the setting as system default."
10		
11		<i>Driver Ranking</i>
12		Under Windows XP, the driver ranking strategy has been modified as follows:
13		If an INF file is unsigned, and if neither the [Models] section nor the [DDInstall]
14		section is decorated with an NT-specific extension, the INF file is considered
15		"suspect" and its rank is shifted into a higher range (that is, worse) than all
16		hardware and compatible rank matches of INF files for which one (or both) of those
17		criteria are met.
18		The new ranking ranges will now be:
19		0 - 0xFFF
20		(DRIVER_HARDWAREID_RANK) :
21		"trusted" hardware-ID match
22		0x1000 - 0x3FFF : "trusted" compatible-ID match
23		0x8000 - 0x8FFF : "untrusted" hardware-ID match
24		0x9000 - 0xBFFF : "untrusted" compatible-ID match
25		0xC000 - 0xCFFF : "untrusted" undecorated hardware-ID match (possibly a Windows 9x-only driver)
26		0xD000 - 0xFFFF : "untrusted" undecorated compatible-ID match (possibly a Windows 9x-only driver)
27		
28	127. A method as in claim 126, in which said authentication information at least in part identifies said first apparatus and/or a	The authentication information will identify Microsoft, operator of the first apparatus.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,185,683

126.	Products Infringing: Microsoft Software that includes the Authenticode feature, .NET Framework SDK, Visual Studio, Microsoft technology that supports a digital signature function (such as ActiveX), Windows Installer technology.
A method of providing trusted intermediary services including the following steps:	Infringement is based on use Microsoft ActiveX control, Cabinet file, Microsoft Windows Installer, Authenticode and Software Restriction Policy technologies. For example, a software publisher distributing a signed application that has licensed ActiveX controls embedded within it would practice this method.
at a first apparatus, receiving an item from a second apparatus;	<p>The item is unsigned software such as an ActiveX control or any software packaged in a cabinet file or Microsoft Installer (.msi) file. Within the development environment, multiple software developers (working on a second apparatus) will send their unsigned software to a secure location (first apparatus) containing the entity's private signing key. An example entity would be a software publisher.</p> <p>Source: Deploying ActiveX Controls on the Web with the Internet Component Download</p> <p>The holder of the digital certificate</p> <p>Keeping your digital certificate safe is very important. Some firms (including Microsoft) do not keep their signature file on site. The signature is kept with the Certificate Authority and files are sent there for signing.</p>
associating authentication information with said item;	<p>Signing the software associates the software publisher's identify with the software.</p> <p>Source: Packaging ActiveX Controls Signing Cabinet Files</p> <p>A .cab file can be digitally signed like an ActiveX control. A digital signature provides accountability for software developers: The signature associates a software vendor's name with a given file. A signature is applied to a .cab file (or control) using the Microsoft Authenticode®</p>

1		technology.
2		The .cab tool set assists software
3		developers in applying digital signatures to
4		.cab files by allowing a developer to
5	incorporating said item into a secure digital	allocate space in the .cab file for the
6	container;	signature.
7	associating a first rule with said secure	Signing software either directly or within a
8	digital container, said first rule at least in	package (cabinet or .msi file) secures it in a
9	part governing at least one aspect of access	digital container.
10	to or use of said item;	Alternately, the signed ActiveX control
11		could be placed into a signed cabinet file.
12		The first rule would be the licensing
13		support code within the ActiveX control
14		and/or conditional syntax statements when
15		the software is within a signed .msi file.
16		When the software is within a signed
17		cabinet file, the first rule can be a rule
18		contained in the software, as is the case
19		when an ActiveX control is packaged in a
20		signed cabinet file.
21		First rule, in the case of ActiveX:
22		When an application with a licensed
23		ActiveX control is started, an instance of
24		the control usually needs to be created.
25		The application accomplishes this by
26		making a call to CreateInstanceLic and
27		passing the license key embedded in the
28		application as a parameter in the call. The
		ActiveX control performs a string
		comparison between the embedded license
		key and its own copy of the license key. If
		the keys match, an instance of the control is
		created and the application can execute
		normally.
		Source: Using ActiveX Controls to
		Automate Your Web Pages
		Run-time licensing
		Most ActiveX Controls should support
		design-time licensing and run-time
		licensing. (The exception is the control that
		is distributed free of charge.) Design-time
		licensing ensures that a developer is
		building his or her application or Web page
		with a legally purchased control; run-time
		licensing ensures that a user is running an
		application or displaying a Web page that
		contains a legally purchased control.
		Design-time licensing is verified by control
		containers such as Visual Basic, Microsoft
		Access, or Microsoft Visual InterDev®.
		Before these containers allow a developer
		to place a control on a form or Web page,

1		they first verify that the control is licensed by the developer or content creator. These containers verify that a control is licensed by calling certain functions in the control: If the license is verified, the developer can add it.
2		Run-time licensing is also an issue for these containers (which are sometimes bundled as part of the final application); the containers again call functions in the control to validate the license that was embedded at design time.
3		
4		
5		
6		
7	transmitting said secure digital container and said first rule to a third apparatus, said third apparatus including a protected processing environment at least in part protecting information stored in said protected processing environment from tampering by a user of said third apparatus;	The third apparatus is a user computer or an application server. The protected processing environment (PPE) is Windows operating system, Internet Explorer (IE) and pertinent operating IE services such as Windows File Protection and security, signature and cryptographic functions related to code signing and related policies. The PPE checks for signatures on software or the software packages and detects situations when the signature does not validate as an indication that tampering may have occurred with the item.

	public key of the publisher.
said third apparatus performing at least one action on said item, said at least one action being governed, at least in part, by said first rule and by a second rule resident at said third apparatus prior to said receipt of said secure digital container and said first rule, said action governance occurring at least in part in said protected processing environment.	The action is executing code that is the item or using code that renders the item. Action is governed by security demands on code that calls the item or on code that calls code included in the .NET assembly that manages said item. The second rule is the machine, enterprise, user, and application configuration file resident rules. Typically these configuration files will be populated before the arrival of most new assemblies in a virtual distribution environment. This action governance occurs in the protected processing environment of the CLR, CLI and/or compact CLR.
127. A method as in claim 126, in which said authentication information at least in part identifies said first apparatus and/or a user of said first apparatus.	The authentication information will identify the .NET Assembly Class company name and trademark attributes that identify the apparatus or user of the first apparatus as being a member of an entity or a branded source (brand name).

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,185,683

126.	Product infringing: Visual Studio .NET, .NET Framework SDK, Authenticode, Products that contain the .NET CLR, Compact CLR or CLI.
A method of providing trusted intermediary services including the following steps: at a first apparatus, receiving an item from a second apparatus;	<p>The item is an unsigned .NET assembly, which can include, but not be limited to, a Web control, multi-file assembly or component. Within the development environment, multiple assembly builders (working on a second apparatus) will send their unsigned assembly to a secure location (first apparatus) containing the entity's private signing key. An example entity would be a software publisher.</p> <p><u>.NET Security Framework – pg 130-1</u></p> <p>Describes this exact practice and further explains the "Delay Signing Assemblies" feature of .NET that accommodates the fact that "many publishers will keep the private key in a secure location, possibly embedded in specially designed cryptographic hardware."</p> <p>"Delay signing is a technique used by developers whereby the public key is added to the assembly name as before, granting the assembly its unique identity, but no signature is computed. Thus, no private key access is necessary."</p>
associating authentication information with said item;	Strong naming the assembly binds the entity's/publisher's name into the assembly. The public portion of the key used to strongly name the assembly is placed in the assembly manifest. Other assemblies or applications can contain references to the strong names of strongly named assemblies such as in the case of applications that contain references to a set of compliant .NET core libraries. Strong naming compliant .NET core libraries with the European Computers Manufactures Association's (ECMA) key is a way to allow any publisher to develop compliant .NET core libraries that can be authenticated by other applications.

1		
2		<u>.NET Security Framework – pg 124</u>
3		“Strong naming is a process whereby an
4		assembly name can be further qualified by
5		the identity of the publisher.”
6		<u>.NET Security Framework – pg 133</u>
7		The publisher must advertise its public key
8		or keys in an out-of-band fashion (such as
9		documentation shipped with the product or
10		on the company Web site)
11		<u>.NET Security Framework – pg 130</u>
12		The goal of the ECMA key is to allow a
13		slightly more generalized strong name
14		binding than usual, namely allowing
15		binding to the publisher of the runtime in
16		use, rather than to a fixed publisher.
17	incorporating said item into a secure digital	Signing the assembly places it in a secure
18	container;	container.
19		<u>.NET Framework Security – pg 527</u>
20		Strong named assemblies cannot be
21		modified in any manner without destroying
22		the strong name signature.
23		<u>Applied Microsoft .NET Framework</u>
24		<u>Programming – pg 89</u>
25		<i>Strongly Named Assemblies Are Tamper-</i>
26		<i>Resistant</i>
27		When the assembly is installed into the
28		GAC, the system hashes the contents of the
		file containing the manifest and compares
		the hash value with the RSA digital
		signature value embedded within the PE
		file (after unsigned it with the public key).
		If the values are identical, the file’s
		contents haven’t been tampered with and
		you know that you have the public key that
		corresponds to the publisher’s private key.
		In addition, the system hashes the contents
		of the assembly’s other files and compares
		the hash values with the hash values stored
		in the manifest file’s FileDef table. If any
		of the hash values don’t match, at least one
		of the assembly’s files has been tampered
		with and the assembly will fail to install
		into the GAC.
23	associating a first rule with said secure	A .NET assembly includes imperative and

A method comprising:	
(a) receiving a digital file including music;	Reference is made to the Windows Media Rights Manager SDK Programming Reference ("WMMR SDK"), attached hereto as Exhibit A. Media Player infringement analysis is set forth herein using the example of a music file downloaded and transferred to a portable audio player. Consumer receives a Windows Media file (WMMR SDK, Step 3)
(b) storing said digital file in a first secure memory of a first device;	Windows Media file is stored in consumer's computer and all use of it is securely managed by the Secure Content Manager in Windows Media Player.
(c) storing information associated with said digital file in a secure database stored on said first device, said information including at least one budget control and at least one copy control, said at least one budget control including a budget specifying the number of copies which can be made of said digital file; and said at least one copy control controlling the copies made of said digital file;	License is stored in the License Store (WMMR SDK, Step 5); license includes Rights which may include AllowTransferToNonSDMI, AllowTransferToSDMI, (or Allow Transfer to WM-D-DRM-Compliant devices or other types of devices), and TransferCount- the number of times a piece of content may be transferred to the device (a transfer budget).
(d) determining whether said digital file may be copied and stored on a second device based on at least said copy control;	Windows Media Rights Manager enforces the license restrictions
(e) if said copy control allows at least a portion of said digital file to be copied and stored on a second device,	Windows Media Rights Manager determines whether the AllowTransferToNonSDMI or AllowTransferToSDMI rights are present. (Or, Allow Transfer to WM-D-DRM-Compliant devices or other types of devices.)
(1) copying at least a portion of said digital file;	Transfer to the SDMI or non-SDMI portable device (Allow Transfer to WM-D-DRM-Compliant devices or other types of devices), if allowed by Windows Media Rights Manager
(2) transferring at least a portion of said digital file to a second device including a memory and an audio and/or video output;	Portable device necessarily includes at least a memory and audio output
(3) storing said digital file in said memory of said second device; and	Music file is transferred to the portable device
(4) including playing said music through said audio output.	Portable device plays the music
2. A method as in claim 1, further comprising:	
(a) at a time substantially contemporaneous with said transferring step, recording in said	Counter reflecting TransferCount is decremented by Windows Media Rights

first device information indicating that said transfer has occurred.	Manager
3. A method as in claim 2, in which:	
(a) said information indicating that said transfer has occurred includes an encumbrance on said budget.	Counter decrement reduces the allowable number of budgeted transfers
4. A method as in claim 3, in which:	
(a) said encumbrance operates to reduce the number of copies of said digital file authorized by said budget.	Counter decrement reduces the allowable number of budgeted transfers

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,253,193

		Infringing products include Windows Media Player and Windows Media Rights Manager SDK
11. A method comprising:		
(a) receiving a digital file;		Consumer receives a Windows Media file (WMM SDK, Step 3)
(b) storing said digital file in a first secure memory of a first device;		Windows Media file is stored in consumer's computer and all use of it is securely managed by the Secure Content Manager in Windows Media Player.
(c) storing information associated with said digital file in a secure database stored on said first device, said information including a first control;		License information is stored in the License Store (WMM SDK, Step 10), license information includes Rights. License Rights may include AllowTransferToNonSDMI, AllowTransferToSDMI (Allow Transfer to WM-D-DRM-Compliant devices or other types of devices), TransferCount
(d) determining whether said digital file may be copied and stored on a second device based on said first control,		WMM determines whether transfer rights are included in license (WMM SDK, Step 5)
(1) said determining step including identifying said second device and determining whether said first control allows transfer of said copied file to said second device, said determination based at least in part on the features present at the device to which said copied file is to be transferred;		Portable Device Service Provider Module identifies the portable device as either SDMI-compliant or non-SDMI-compliant (or WM-D-DRM Compliant or other types of supported devices) and provides this information to Windows Media Device Manager, which allows the transfer based on whether the device identification matches the License Right.
(e) if said first control allows at least a portion of said digital file to be copied and stored on a second device,		If Windows Media Rights Manager determines whether the AllowTransferToNonSDMI or AllowTransferToSDMI rights are present (or Allow Transfer to WM-D-DRM-Compliant devices or other types of devices), the following steps are performed:
(1) copying at least a portion of said digital file;		Transfer to the SDMI or non-SDMI (Allow Transfer to WM-D-DRM-Compliant or other) portable device, if allowed by Windows Media Rights Manager
(2) transferring at least a portion of said digital file to a second device including a memory and an audio and/or video output;		Portable device necessarily includes at least a memory and audio output
(3) storing said digital file in said memory of said second device; and		Music file is stored in the portable device
(4) rendering said digital file through said output.		Portable device plays the music

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,253,193

		Product infringing: Windows Media Player, Windows Media Player, Windows Media Rights Manager SDK
15.	A method comprising:	
(a)	receiving a digital file;	Consumer receives a Windows Media file ((WMRM SDK, Step 3)
(b)	an authentication step comprising:	
(1)	accessing at least one identifier associated with a first device or with a user of said first device; and	License includes identity of user's Windows Media Player: WM Players capable of playing protected content must be individualized. They contain a unique (Individualized) DRM client component to which protected WMA content licenses are bound. Content licenses are bound to this DRM individualization module as the result of a challenge sent from the Client to the WMLM service. The challenge contains information about Individualized DRM Client (in the form of an encrypted Client ID) and capabilities of the machine (e.g. support for Secure Audio Path (SAP), version of the WMRM SDK supported in the player.
(2)	determining whether said identifier is associated with a device and/or user authorized to store said digital file;	Music file cannot be used unless identifier indicated in License matches user's Windows Media Player identifier (that is, the Individualized DRM Client to which the license is bound must be the same one supported by the device).
(c)	storing said digital file in a first secure memory of said first device, but only if said device and/or user is so authorized, but not proceeding with said storing if said device and/or user is not authorized;	Music file will not be processed through Windows Media Player, including protected rendering buffers, unless the identifiers match. Protected WMA file can be stored on client even if unauthorized but it cannot be decrypted and enter into the secure boundary (first secure memory) of the player unless appropriately licensed.
(d)	storing information associated with said digital file in a secure database stored on said first device, said information including at least one control;	License includes Rights and is stored in the License Store, Rights may include AllowTransferToNonSDMI, AllowTransferToSDMI, (or Allow Transfer To WM-D-DRM-CompliantDevice or other device) TransferCount
(e)	determining whether said digital file may be copied and stored on a second device based on said at least one control;	Windows Media Rights Manager enforces the license restrictions
(f)	if said at least one control allows at least a portion of said digital file to be copied and stored on a second device,	If appropriate rights are present, the following steps are performed:
(1)	copying at least a portion of said	Transfer to the SDMI or non-SDMI (or WM-

1	digital file;	D-DRM Compliant or other) portable device, if allowed by Windows Media Rights Manager
2	(2) transferring at least a portion of said digital file to a second device	Portable device necessarily includes at least a memory and audio output
3	including a memory and an audio and/or video output;	
4	(3) storing said digital file in said memory of said second device; and	Music file is stored in the portable device
5	(4) rendering said digital file through said output.	Portable device plays the music
6	16. A method as in claim 15, in which:	
7	said digital file is received in an encrypted form;	Protected Windows Media File is encrypted. WMP will not decrypt file until license is processed. Licenses are bound to Individualization DLLs, which are bound to Hardware ID. Ind. DLL and Hardware ID must be verified as the Ids to which the license is bound – this is the authentication process.
8	and further comprising:	(Recall that this module was created based in part on receipt of the Client Hardware ID or fingerprint and the license was create based in part on receipt of a challenge from the client indicating the security properties (SAP-ready, SDK support, etc.) of the client).
9	decrypting said digital file after said authentication step and before said step of storing said digital file in said memory of said first device.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,253,193

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
19.	Infringing products include Office 2003 and included applications, and Server 2003, including Microsoft hosted RMS Service using Passport
A method comprising:	
receiving a digital file at a first device;	Receiving a digital file such as a Word Document, email, Excel spreadsheet, PowerPoint presentation, or other content at a recipient's device. Such content may be received via email, received on removable media, such as floppy disk, downloaded and viewable by Internet Explorer, e.g., a web page possibly containing graphics and/or audio data, etc.
establishing communication between said first device and a clearinghouse located at a location remote from said first device;	If the digital file is subject to rights management, and the recipient tries to open the digital file in an IRM-enabled application, the IRM-enabled application contacts a remote RMS, i.e., clearinghouse for a use license.
said first device obtaining authorization information including a key from said clearinghouse;	If the recipient is authorized to access or use the digital file, the RMS creates a license for the digital file. The RMS then seals a key inside the license so that only the recipient can access or use the digital file. Finally, the RMS sends the license back to the recipient.
said first device using said authorization information to gain access to or make at least one use of said first digital file, including using said key to decrypt at least a portion of said first digital file; and	The recipient's device then uses the key in the license to gain access or decrypt a portion of the digital file.
receiving a first control from said clearinghouse at said first device;	The license received from the RMS at the recipient's device contains at least one control, such as restricting the ability to print, forward, or edit.
storing said first digital file in a memory of said first device;	The digital file is stored in the memory of the said recipient's device, such as in RAM, on a hard drive, etc.
using said first control to determine whether said first digital file may be copied and stored on a second device;	The at least one control in the license limits copying the digital file. Such controls are set when the digital file was authored. For example, when the digital file is authored, the IRM-enabled application presented the author with a list of policy templates with different rights levels. The author selected an appropriate rights level which may for instance, allow other users in the system to open and read the document, but not

	<p>to modify it, copy text from it, or forward it. These rights or controls are then associated with the digital file.</p> <p>When an attempt is made to access the digital file, the RMS determines the recipient's rights based on the recipient's identity and the policies or controls associated with the digital file.</p>
if said first control allows at least a portion of said first digital file to be copied and stored on a second device.	If the control in the license allows copying the digital file to a second device, then at least a portion of the digital file is copied,
copying at least a portion of said first digital file;	such as by transferring or forwarding the digital file in an email message;
transferring at least a portion of said first digital file to a second device including a memory and an audio and/or video output;	A portion of the digital file is then transferred to a second device, such as a personal computer or portable device. The second device includes a memory and an audio and/or video output. The memory may be a hard-drive, RAM, CD, DVD, or other storage. The audio and/or video output may be speakers and/or a video monitor.
storing said first digital file portion in said memory of said second device; and	The digital file is stored in the second device's memory.
rendering said first digital file portion through said output.	The digital file is rendered through the output, such as played through the speakers and/or displayed on the video monitor. For example, a Word document is displayed on the screen of the video monitor.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,253,193

		Infringing products include Windows Media Player, Windows Media Rights Manager SDK
	19. A method comprising:	
	(a) receiving a digital file at a first device;	WMRM SDK, Step 3.
	(b) establishing communication between said first device and a clearinghouse located at a location remote from said first device;	WMRM SDK, Step 6.
	(c) said first device obtaining authorization information including a key from said clearinghouse;	WMRM SDK, Step 9. [License contains the key]
	(d) said first device using said authorization information to gain access to or make at least one use of said first digital file, including using said key to decrypt at least a portion of said first digital file; and	WMRM SDK, Step 11.
	(e) receiving a first control from said clearinghouse at said first device;	WMRM SDK, Steps 8-9.
	(f) storing said first digital file in a memory of said first device;	WMRM SDK, Step 3.
	(g) using said first control to determine whether said first digital file may be copied and stored on a second device;	At least the following WMRMRights Object properties meet this limitation: AllowTransferToNonSDMI, AllowTransferToSDMI (or AllowTransfer To WM-D-DRM-Compliant Device or other) and TransferCount
	(h) if said first control allows at least a portion of said first digital file to be copied and stored on a second device,	This and all subsequent claim steps occur when the condition specified in the WMRMRights Object property is met
	(i) copying at least a portion of said first digital file;	Transfer to the SDMI or non-SDMI (or WM-D-DRM Compliant) portable device, if allowed by Windows Media Rights Manager
	(j) transferring at least a portion of said first digital file to a second device including a memory and an audio and/or video output;	Portable device necessarily includes at least a memory and audio output
	(k) storing said first digital file portion in said memory of said second device; and	Music file is stored in the portable device
	(l) rendering said first digital file portion through said output.	Portable device plays the music

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,253,193

	Infringing products include Windows Media Player, Windows Media Player, Windows Media Rights Manager SDK
51. A method comprising:	
(a) receiving a digital file at a first device;	WMRM SDK, Step 3.
(b) establishing communication between said first device and a clearinghouse located at a location remote from said first device;	WMRM SDK, Step 6.
(c) said first device obtaining authorization information from said clearinghouse; and	WMRM SDK, Step 9.
(d) said first device using said authorization information to gain access to or make at least one use of said first digital file;	WMRM SDK, Step 11.
(e) storing said first digital file in a memory of said first device;	WMA file stored on client
(f) using at least a first control to determine whether said first digital file may be copied and stored on a second device, said determination based at least in part on (1) identification information regarding said second device, and (2) the functional attributes of said second device;	If device is based on WM D-DRM, it has a certificate that is used to identify the device as compliant as well as the device's security level. The security level indicates support on the device for such attributes as an internal clock.
(g) if, based at least in part on said identification information, said first control allows at least a portion of said first digital file to be copied and stored on a second device,	If License specifies that transfer of protected WMA file to WM-D-DRM-Compliant device is allowed, transfer may occur.
(h) copying at least a portion of said first digital file;	If transfer is a licensed right as indicated in the license, the song is copied to the device via Windows Media Device Manager.
(i) transferring at least a portion of said first digital file to a second device including a memory and an audio and/or video output;	Windows Media Device Manager transfers the content to the device.
(j) storing said first digital file portion in said memory of said second device; and	WMA file is stored on device
(k) rendering said first digital file portion through said output.	WMA file is rendered.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
33.	Infringing products include all Microsoft tools that support the Microsoft ActiveX licensing model, Visual Studio .NET, the Microsoft Installer SDK, and Operating System products that include the Microsoft Installer technology.
A data processing arrangement comprising at least one storing arrangement that at least temporarily stores a first secure container comprising first protected data and a first set of rules governing use of said first protected data,	<p>The first protected data is an ActiveX control.</p> <p>The first alternative for the first secure container is the signed .msi in which the ActiveX developer packaged the ActiveX control. The first set of rules is the conditional syntax statements of the signed .msi file.</p> <p>The second alternative for the first secure container is the signed and licensed ActiveX control. The first set of rules is the license support code in the ActiveX control.</p> <p>A third alternative for the first container is a signed cabinet file containing a (signed or unsigned) ActiveX control with license support code. The first set of rules is the license support code in the ActiveX control.</p>
and at least temporarily stores a second secure container comprising second protected data different from said first protected data and a second set of rules governing use of said second protected data; and	The second protected data is the application developer's application that includes/uses the ActiveX control. The application developer's signed .msi file (second secure container) contains the application (second protected data). The second set of rules is the signed .msi file's conditional syntax statements that will be governed the offer/installation of the application.
a data transfer arrangement, coupled to at least one storing arrangement, for transferring at least a portion of said first protected data and a third set of rules governing use of said portion of said first protected data to said second secure container,	Placing the licensed ActiveX control (first protected information) in a signed cabinet file (third secure container) that itself is included in the application's signed .msi file (second secure container). The third set of rules is the license support code in the ActiveX control.
further comprising	
means for creating and storing, in said at least one storing arrangement, a third secure container;	The ability of the application developer to package files in signed cabinet files.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

81.	Infringing products include all Microsoft tools that support the Microsoft ActiveX licensing model, Visual Studio .NET, the Microsoft Installer SDK, and Operating System products that include the Microsoft Installer technology.
A data processing arrangement comprising:	
a first secure container comprising first protected information and a first rule set governing use of said first protected information;	<p>The first alternative for the first secure container is the ActiveX control developer's signed .msi file containing a licensed ActiveX control (the first protected information). The conditional syntax statements of the signed .msi file are the first rule set.</p> <p>The second alternative for the first secure container is the signed cabinet file containing the ActiveX control. The license support code in the ActiveX control is the first rule set.</p> <p>The third alternative for the first secure container is the licensed and signed ActiveX control governed by license support code in the ActiveX control.</p>
a second secure container comprising a second rule set;	The second secure container is the signed .msi file which the application developer package its application. The second rule set is the conditional syntax statements of the application developer's signed .msi file.
means for creating and storing a third secure container; and	The third container is a signed cabinet file containing at least the ActiveX control.
means for copying or transferring at least a portion of said first protected information and a third rule set governing use of said portion of said first protected information to said second secure container, said means for copying or transferring comprising:	Putting the licensed ActiveX control (first protected information) in a signed cabinet file (third secure container). The licensing support code in the ActiveX control is third rule set.
means for incorporating said third secure container within said second secure container.	Packaging the signed cabinet file in the signed .msi file.
82. A data processing arrangement as in claim 81 further comprising:	
means for applying at least one rule from said third rule set to at least in part govern at least one factor related to use of said portion of said first protected information.	The third rule set ensures the user is licensed.
83. A data processing arrangement as in claim 82 further comprising:	

1

means for applying at least one rule from said second rule set to at least in part govern at least one factor related to use of said portion of said first protected information.	The second rule set governs the offer/installation of first protected information.
---	--

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

85.	Infringing products include all Microsoft tools that support the Microsoft ActiveX licensing model, Visual Studio .NET, the Microsoft Installer SDK, and Operating System products that include the Microsoft Installer technology.
A method comprising the following steps:	
creating a first secure container comprising a first rule set and first protected information;	<p>The first protected information is the ActiveX control.</p> <p>The first alternative for the first secure container is the signed and licensed ActiveX control. The first rule set is the license support code in the ActiveX control.</p> <p>The second alternative for the first secure container is an (signed or unsigned) ActiveX control with license support contained within a signed cabinet file. The first rule set is the ActiveX license support code.</p>
storing said first secure container in a first memory;	The first secure container is stored at the ActiveX control developer's location.
creating a second secure container comprising a second rule set;	The second secure container is the application developer's signed .msi file. The conditional syntax statements of the signed .msi file are the second rule set.
storing said second secure container in a second memory;	The second secure container is stored at the application developer's location.
copying or transferring at least a first portion of said first protected information to said second secure container, said copying or transferring step comprising:	The ActiveX control developer packages the control in a signed .msi file for distribution to the application developer's site.
creating a third secure container comprising a third rule set;	The third secure container is the ActiveX control developer's signed .msi file containing a licensed ActiveX control. The conditional syntax statements of the signed .msi file are the third rule set.
copying said first portion of said first protected information;	In preparation for using a msi authoring tool, such as Microsoft's Orca, copying the ActiveX control to a package staging area.
transferring said copied first portion of said first protected information to said third secure container; and	Using msi authoring tool to import the control into the signed .msi file.
copying or transferring said copied first portion of said first protected information from said third secure container to said second secure container.	The application developer installs the ActiveX control, which involves removing it from the ActiveX developer's signed .msi file and installing it into its environment. Subsequently, the

	application developer places the ActiveX control into its signed .msi file when it is packaging its application.
87. A method as in claim 85 in which said copied first portion of said first protected information consists of the entirety of said first protected information.	The entire ActiveX control is copied.
89. A method as in claim 85 in which said first memory is located at a first site,	The first memory is located at the ActiveX control developer's site.
said second memory is located at a second site remote from said first site, and	The second memory is located at the application developer's site.
said step of copying or transferring said first portion of said first protected information to said second secure container further comprises copying or transferring said third secure container from said first site to said second site.	The ActiveX control developer's signed .msi file is transferred from its site to the site of the application developer.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

85. (alternate infringing scenario)	Infringing products include all Microsoft tools that support the Microsoft ActiveX licensing model, Visual Studio .NET, the Microsoft Installer SDK, and Operating System products that include the Microsoft Installer technology.
A method comprising the following steps:	
creating a first secure container comprising a first rule set and first protected information;	<p>The first protected information is the ActiveX control.</p> <p>The first alternative for the first secure container is the signed and licensed ActiveX control. The first rule set is the license support code in the ActiveX control.</p> <p>The second alternative for the first secure container is a (signed or unsigned) ActiveX control with license support contained within a signed cabinet file. The first rule set would remain the ActiveX license support code.</p> <p>The third alternative for the first secure container is a signed msi file in which the ActiveX control developer packaged its ActiveX control. The first rule set is the conditional syntax statement(s) of the signed msi file.</p>
storing said first secure container in a first memory;	The first secure container is stored at the ActiveX control developer's location.
creating a second secure container comprising a second rule set;	The second secure container is the application developer's signed .msi file. The conditional syntax statements of the signed .msi file are the second rule set.
storing said second secure container in a second memory;	The second secure container is stored at the application developer's location.
copying or transferring at least a first portion of said first protected information to said second secure container, said copying or transferring step comprising:	The ActiveX control is placed in a cabinet file signed by the application developer and the signed cabinet file is placed in a .msi file signed by the application developer.
creating a third secure container comprising a third rule set;	The third secure container is signed cabinet file in which the application developer placed licensed ActiveX. The third rule set is the license support code in the ActiveX control.
copying said first portion of said first protected information;	Copying ActiveX control.
transferring said copied first portion of said first protected information to	Transferring ActiveX control to signed cabinet file.

1	said third secure container; and	
2	copying or transferring said copied	The application developer places the signed cabinet file into its signed .msi file when it is packaging its application.
3	first portion of said first protected	
4	information from said third secure container to said second secure container.	
5	87. A method as in claim 85 in which said	The entire ActiveX control is copied.
6	copied first portion of said first protected information consists of the entirety of said first protected information.	
7	93. A method as in claim 85 in which	
8	said step of copying transferring said	The ActiveX control is placed in a cabinet file signed by the application developer and the signed cabinet file is placed in a .msi file signed by the application developer.
9	copied first portion of said first protected information from said third secure container to said second secure container	
10	further comprises storing said third secure container in said second secure container.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.

INTERTRUST INFRINGEMENT CHART

FOR U.S. PATENT NO. 5,915,019

1:	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
A method of operating on a first secure container arrangement having a first set of controls associated therewith, said first secure container arrangement at least in part comprising a first protected content file, said method comprising the following steps performed within a virtual distribution environment including at least one electronic appliance:	The first protected content is a signed and licensed .NET component used by the .NET assembly. The .NET assembly is distributed with a signed and governed .msi file. The second protected content is another signed and licensed .NET component that is used by the .NET assembly.
using at least one control associated with said first secure container arrangement for governing, at least in part, at least one aspect of use of said first protected content file while said first protected content file is contained in said first secure container arrangement;	The first protected content is signed and licensed .NET component (first secure container) contained within the .NET assembly. The one control is a declarative statement(s) within the assembly's header.
creating a second secure container arrangement having a second set of controls associated therewith, said second set of controls governing, at least in part, at least one aspect of use of any protected content file contained within said second secure container arrangement;	The protected content is the same as the first protected content plus the additional implementation information included in the signed .msi file. The second secure container is the signed .msi file created for the .NET assembly. The signed .msi file's conditional syntax statements are the second set of controls that control the offer/installation of the .NET assembly.
transferring at least a portion of said first protected content file to said second secure container arrangement, said portion made up of at least some of said first protected content file; and	The entire .NET assembly is included in the signed .msi file. Packaging the .NET assembly in the signed .msi file involves the following process steps. In preparation for using a msi authoring tool, such as Microsoft's Orca, copying the .NET component to a package staging area. Using msi authoring tool to import the .NET component into the signed .msi file.
using at least one rule to govern at least one aspect of use of said first protected content file portion while said portion is contained within said second secure container arrangement;	The conditional syntax statement(s) of the signed .msi file (second secure container) control(s) the offer/installation of the .NET assembly.
in which	
said first secure container arrangement comprises a third secure container	The first alternative for the third secure container is a licensed and signed .NET

arrangement comprising a third set of controls and said first protected content file, and	component governed by the set of declarative statements comprising the LicenseProviderAttribute (third set of controls). The second alternative for the third secure container is a .NET component whose hash is included in the header of the .NET assembly. The set of declarative statements comprising the LicenseProviderAttribute is the third set of controls.
said first secure container arrangement further comprises a fourth secure container arrangement comprising a fourth set of controls and a second protected content file.	The first alternative for the fourth secure container is another licensed and signed .NET component governed by the set of declarative statements comprising the LicenseProviderAttribute (fourth set of controls). The second alternative for the fourth secure container is the container created when the hash of the .NET component is included in the header information of the .NET assembly. The set of declarative statements comprising the LicenseProviderAttribute is the fourth set of controls.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

33.	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
A data processing arrangement comprising at least one storing arrangement that at least temporarily stores a first secure container comprising first protected data and a first set of rules governing use of said first protected data,	<p>The first protected information is the .NET component.</p> <p>The first alternate for the first secure container is the signed .msi file in which the .NET component developer packaged its .NET component. The first set of rules is the conditional syntax statements of the signed .msi file.</p> <p>The second alternative for the first secure container is a licensed and signed .NET component governed by the set of declarative statements comprising the LicenseProviderAttribute of the .NET component (first set of controls).</p> <p>The third alternative for the first container is a signed cabinet file containing a (signed or unsigned) .NET component with license support. The first set of controls is the set of declarative statements comprising the LicenseProviderAttribute of the .NET component.</p>
and at least temporarily stores a second secure container comprising second protected data different from said first protected data and a second set of rules governing use of said second protected data; and	<p>The second protected data is the .NET assembly developer's assembly that includes/uses the .NET component.</p> <p>The first alternative for the second secure container is a signed .msi file in which the .NET assembly developer packaged its multi-file assembly (second protected data). The second set of rules is the conditional syntax statements of the signed .msi file that governs the offer/installation of the .NET assembly.</p> <p>The second alternative for the second secure container is a signed .NET assembly. The second set of rules is the declarative rules within the assembly's header.</p>
a data transfer arrangement, coupled to at least one storing arrangement, for	The third secure container is a signed .NET assembly governed by declarative rules in

1 2 3 4 5 6 7 8 9 10 11 12 13	transferring at least a portion of said first protected data and a third set of rules governing use of said portion of said first protected data to said second secure container,	its header (third set of rules). An alternative third rule set is the set of declarative statements comprising the LicenseProviderAttribute. The .NET assembly includes the .NET component. The secure .NET assembly is included in a signed .msi file (second secure container). An alternative third secure container is the container created by hashing the .NET component and including the hash in the header information of a .NET assembly. The .NET component is included in the signed and governed .NET assembly (second secure container). The third set of rules is the set of declarative statements comprising the LicenseProviderAttribute. An alternative third secure container is a signed cabinet file containing the .NET component and which is destined for a signed .msi file (second secure container). The third set of rules is the set of declarative statements comprising the LicenseProviderAttribute.
14	further comprising	
15 16 17 18 19 20 21 22 23	means for creating and storing, in said at least one storing arrangement, a third secure container;	The first alternative for the third secure container is a signed .NET assembly. In this case, the second secure container is the signed .msi file. The second alternative for the third container is the container created by including a hash of the .NET component in the header information of a .NET assembly. In this case, the second secure container is either the signed .msi file or the signed .NET assembly. The third alternative for the third container is a cabinet file signed by the .NET assembly developer containing the .NET assembly and/or the .NET component. In this case the signed .msi file is the second secure container.
24 25 26 27 28	said data transfer arrangement further comprising means for transferring said portion of said first protected data and said third set of rules to said third secure container, and means for incorporating said third secure container within said second secure container.	The first alternative for the third secure container is the signed .NET assembly, which includes and/or uses the licensed .NET component (first protected information). The third set of rules is a declarative rule within the .NET assembly's header. The .NET assembly is placed in a signed .msi file (second secure container).

1		The second alternative for the third secure container is the container that results when the hash of the .NET component is added to the .NET assembly header information. The third set of rules is the set of declarative statements comprising the LicenseProviderAttribute added to the assembly.
2		
3		
4		
5		
6		The third alternative for the third secure container is a cabinet file signed by the .NET assembly developer containing the .NET assembly and/or the .NET component. The third set of rules is a declarative rule(s) within the .NET assembly's header and/or the set of declarative statements comprising the LicenseProviderAttribute added to the assembly.
7		
8		
9		
10		
11		
12	34. A data processing arrangement as in claim 33 further comprising means for applying said third set of rules to govern at least one aspect of use of said portion of said first protected data.	When the third rule set is the declarative statement(s) of the assembly header, the runtime CLR enforces the statements.
13		
14		When the third set of rules is the set of declarative statements comprising the LicenseProviderAttribute added to the assembly, the license support code in the .NET component evaluates the authenticity of the calling assembly's request.
15		
16		
17	35. A data processing arrangement as in claim 34 further comprising means for applying said second set of rules to govern at least one aspect of use of said portion of said first protected data.	When the second set of rules is the conditional syntax statements of the signed .msi file, the Windows Installer operating system service enforces the conditional syntax statements of .NET assembly's signed .msi file, which govern the offer/installation of the .NET component.
18		
19		
20		
21		When the second set of rules is the declarative statement(s) within the assembly's header, the runtime CLR enforces the statements.
22		
23

26		
27		
28		

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.

**INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019**

41.	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
A method comprising performing the following steps within a virtual distribution environment comprising one or more electronic appliances and a first secure container, said first secure container comprising (a) a first control set, and	The signed .msi file created by the .NET component developer is the first secure container. The first conditional syntax statement(s) of the .NET component developer's signed .msi file is/are the first control set.
(b) a second secure container comprising a second control set and first protected information:	The first protected information is the .NET component. The first alternative for the second secure container is the signed and licensed .NET component. The second control set is the set of declarative statements comprising the LicenseProviderAttribute. The second alternative for the second secure container is a signed cabinet file. The second control set remains the set of declarative statements comprising the LicenseProviderAttribute.
using at least one control from said first control set or said second control set to govern at least one aspect of use of said first protected information while said first protected information is contained within said first secure container;	The .NET component developer's conditional syntax statements (first control set) in its signed .msi file governs the offer/installation of the .NET component while it is in the signed .msi file. Alternately, the set of declarative statements comprising the LicenseProviderAttribute (second control set) of the licensed .NET component governs use of the .NET component.
creating a third secure container comprising a third control set for governing at least one aspect of use of protected information contained within said third secure container;	The first alternative for the third secure container is a signed .NET assembly, the protected information is the .NET component and the third control set is the declarative statement(s) within the .NET assembly's header. The second alternative for the third secure container is a signed .msi file in which the .NET assembly developer packages its .NET assembly and the third control set is the conditional syntax statement(s) in the signed .msi file.

1	incorporating a first portion of said first	In the first alternative, placing the .NET
2	protected information in said third secure	component into the signed .NET assembly.
3	container, said first portion made up of	
4	some or all of said first protected	In the second alternative, placing the .NET
5	information; and	component into the .NET assembly
6		developer's signed .msi file.
7	using at least one control to govern at least	In the first alternative, the .NET assembly
8	one aspect of use of said first portion of	developer's declarative statement(s) within
9	said first protected information while said	the .NET assembly's header govern(s) the
10	first portion is contained within said third	use of the .NET component while it is in
11	secure container.	the signed .NET assembly.
12		In the second alternative, the conditional
13		syntax statements of the .NET assembly
14		developer's signed .msi file govern the
15		offer/installation of the .NET component
16		while it is in the signed .msi file.
17		
18	42. A method as in claim 41, in which said	The second protected information is a
19	first secure container further includes a	second .NET component.
20	fourth secure container comprising a fourth	
21	control set and second protected	The first alternative for the fourth secure
22	information and further comprising the	container is the signed and licensed second
23	following step:	.NET component. The fourth control set is
24		the set of declarative statements comprising
25		the LicenseProviderAttribute of the second
26		.NET component.
27		The second alternative for the fourth secure
28		container is a second signed cabinet file.
		The fourth control set is the set of
		declarative statements comprising the
		LicenseProviderAttribute.
	using at least one control from said first	The .NET component developer's
	control set or said fourth control set to	conditional syntax statements (first control
	govern at least one aspect of use of said	set) in its signed .msi file governs the
	second protected information while said	offer/installation of the second .NET
	second protected information is contained	component while it is in the signed .msi
	within said first secure container.	file.
		Alternately, the set of declarative
		statements comprising the
		LicenseProviderAttribute (fourth control
		set) of the licensed second .NET
		component governs use of the second .NET
		component.
25	47. A method as in claim 41, in which said	
26	step of creating a third secure container	
27	includes:	
28	creating said third control set by	The .NET assembly developer's declarative
	incorporating at least one control not found	statements (first alternative for third control
	in said first control set or said second	set) and/or the developer's conditional
	control set.	syntax statements (second alternative for
		the third control set) are not found in either

1		the first control set or the second control set.
2		
3	52. A method as in claim 41 in which said step of creating a third secure container occurs at a first site, and further comprising:	
4		
5	copying or transferring said third secure container from said first site to a second site located remotely from said first site.	The .NET assembly developer at first site distributes its assembly to other sites.
6		
7	53. A method as in claim 52 in which said first site is associated with a content distributor.	The .NET assembly developer's business module is used to create and distribute its assembly.
8		
9	54. A method as in claim 53 in which said second site is associated with a user of content.	The .NET assembly developer distributes the assembly to end-users.
10		
11	55. A method as in claim 54 further comprising the following step:	
12	said user directly or indirectly initiating communication with said first site.	For Internet downloads, the user initiates the communication with the first site.
13		
14	64. A method as in claim 54 in which said third control set includes one or more controls at least in part governing the use by said user of at least a portion of said first portion of said first protected information.	When the third control set is the .NET assembly developer's declarative statement(s) within the .NET assembly's header, it governs the user's use of the .NET component (first protected information).
15		
16		
17		When the third control set is the .NET assembly developer's conditional syntax statements of the .NET assembly developer's signed .msi file, it governs the user's offer acceptance/installation of the .NET component (first protected information).
18		
19		
20		
21	76. A method as in claim 41 in which said creation of said third secure container further comprises using a template which specifies one or more of the controls contained in said third control set.	When the third secure container is the .NET assembly developer's signed .msi file and the third control set is the conditional syntax statements in that file.
22		
23		Microsoft supplies several template .msi databases for use in authoring installation packages. The UISample.msi is the template recommended in the "An Installation Example" on MSDN. This template msi files contains several default conditional syntax statements. At least two of these conditional syntax statements directly govern the installation by blocking progress until the EULA is accepted.
24		
25		
26		
27		
28		

1 78. A method as in claim 52 in which said
2 creation of said third secure container
3 further comprises using a template which
4 specifies one or more of the controls
5 contained in said third control set.

When the third secure container is the
.NET assembly developer's signed .msi file
and the third control set is the conditional
syntax statements in that file.

Microsoft supplies several template .msi
databases for use in authoring installation
packages. The UISample.msi is the
template recommended in the "An
Installation Example" on MSDN. This
template msi files contains several default
conditional syntax statements. At least two
of these conditional syntax statements
directly govern the installation by blocking
progress until the EULA is accepted.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

81.	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
A data processing arrangement comprising:	
a first secure container comprising first protected information and a first rule set governing use of said first protected information;	<p>The first protected information is the .NET component.</p> <p>The first alternative for the first secure container is the signed .msi file in which the .NET component developer packaged its assembly. The first rule set is the conditional syntax statements written by the .NET component developer and placed into the signed .msi file.</p> <p>The second alternative for the first secure container is the signed cabinet file containing the (signed or unsigned) .NET component. The set of declarative statements comprising the LicenseProviderAttribute when its developer added licensing support to the assembly is the first rule set.</p> <p>The third alternative for the first secure container is the licensed and signed .NET component governed by the set of declarative statements comprising the LicenseProviderAttribute (first rule set) added by the .NET component developer.</p>
a second secure container comprising a second rule set;	<p>The first alternative for the second secure container is the signed .msi file in which the .NET assembly developer packaged its .NET assembly. The second rule set is the conditional syntax statements written by the .NET assembly developer and placed into the signed .msi file.</p> <p>The second alternative for the second secure container is the signed .NET assembly. The second rule set is the declarative statements in the .NET assembly's header.</p>
means for creating and storing a third secure container; and	<p>When the second secure container is the signed msi file, the third secure container is the signed .NET assembly.</p> <p>When the second secure container is the</p>

1		signed .NET assembly, the third secure container a .NET component secured by placing it in a signed cabinet file or by including its hash in the header of the assembly.
2		
3		
4	means for copying or transferring at least a portion of said first protected information and a third rule set governing use of said portion of said first protected information to said second secure container, said means for copying or transferring comprising:	When the second secure container is the signed msi file and the third secure container is the signed .NET assembly, the third rule set is the set of declarative statements within the assembly's header.
5		
6		
7		When the second secure container is the signed .NET assembly, the third rule set is the set of declarative statements comprising the LicenseProviderAttribute (third rule set) added to the .NET component by its developer.
8		
9		
10	means for incorporating said third secure container within said second secure container.	When the second secure container is the signed msi file and the third secure container is the signed .NET assembly, the assembly is placed in the signed .msi file.
11		
12		
13		When the second secure container is the signed .NET assembly and the third secure container is a .NET component contained in a signed cabinet file or a .NET component whose hash is included in the header of the assembly, the third secure container is incorporated within the .NET assembly.
14		
15		
16		
17	82. A data processing arrangement as in claim 81 further comprising:	
18	means for applying at least one rule from said third rule set to at least in part govern at least one factor related to use of said portion of said first protected information.	When the third rule set is declarative statements within the assembly's header, it governs the use of the .NET assembly which includes the first protected information.
19		
20		
21		When the third rule set is the set of declarative statements comprising the LicenseProviderAttribute added by the .NET component by its developer, it ensures the user is licensed.
22		
23		
24	83. A data processing arrangement as in claim 82 further comprising:	
25	means for applying at least one rule from said second rule set to at least in part govern at least one factor related to use of said portion of said first protected information.	When the second rule set is the conditional syntax statements written by the .NET assembly developer and placed into the signed .msi file, it governs the offer/installation of the .NET component.
26		
27

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.

**INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019**

85. A method comprising the following steps:	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
creating a first secure container comprising a first rule set and first protected information;	<p>The first protected information is the .NET component.</p> <p>The first secure container is a signed .NET component (first protected information) governed by the set of declarative statements comprising the LicenseProviderAttribute (first rule set).</p> <p>The second alternative for the first secure container is a cabinet file signed by the .NET component developer containing a (signed or unsigned) .NET component with license support. The first rule set is the set of declarative statements comprising the LicenseProviderAttribute.</p>
storing said first secure container in a first memory;	The first secure container is stored at the .NET component developer's location.
creating a second secure container comprising a second rule set;	<p>The first alternative for the second secure container is a signed .NET assembly and the second rule set is declarative statement(s) within the assembly's header.</p> <p>The second alternative for the second secure container is the signed .msi file in which the .NET assembly developer packages its (signed or unsigned) assembly. The second rule set is the conditional syntax statement(s) written by the .NET assembly developer and placed into the signed .msi file.</p>
storing said second secure container in a second memory;	The second secure container is stored at the .NET assembly developer's location.
copying or transferring at least a first portion of said first protected information to said second secure container, said copying or transferring step comprising:	The .NET component developer packages its module in a signed .msi file for distribution to the .NET assembly developer's site.
creating a third secure container comprising a third rule set;	The third secure container is the signed .msi file in which the .NET component developer packaged its .NET component. The third control set is the conditional syntax statements written by the .NET component developer and placed into the signed .msi file.
copying said first portion of said	In preparation for using a msi authoring

1	first protected information;	tool, such as Microsoft's Orca, copying the .NET component to a package staging area.
2	transferring said copied first portion	Using the msi authoring tool to import the
3	of said first protected information to	.NET component into the signed .msi file.
4	said third secure container; and	
5	copying or transferring said copied	The .NET assembly developer installs the
6	first portion of said first protected	.NET component, which involves
7	information from said third secure	removing it from the .NET component
8	container to said second secure	developer's signed .msi file and installing it
	container.	into its environment. Subsequently, the
		.NET assembly developer places the .NET
		component into its .NET assembly and/or
		signed .msi file when it is packaging its
		.NET assembly.
9	87. A method as in claim 85 in which said	The entire .NET component is copied.
10	copied first portion of said first protected	
11	information consists of the entirety of said	
12	first protected information.	
13	89. A method as in claim 85 in which	
14	said first memory is located at a first site,	The first memory is located at the .NET
15	said second memory is located at a second	component developer's site.
16	site remote from said first site, and	The second memory is located at the .NET
17	said step of copying or transferring said	assembly developer's site.
18	first portion of said first protected	The .NET component developer's signed
19	information to said second secure container	.msi file is transferred from its site to the
20	further comprises copying or transferring	site of the .NET assembly developer.
21	said third secure container from said first	
22	site to said second site.	
23	94. A method as in claim 85 further	
24	comprising:	
25	creating a fourth rule set.	When the second secure container is not a
26		signed .NET assembly, the fourth rule set is
27		declarative statements within the
28		assembly's header.
		When the second secure container is not
		the signed .msi file in which the .NET
		assembly developer packages its (signed or
		unsigned) assembly, the fourth rule set is
		the conditional syntax statements written
		by the .NET assembly developer and
		placed into the signed .msi file.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

85 (alternate infringing scenario)	
A method comprising the following steps:	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
creating a first secure container comprising a first rule set and first protected information;	<p>The first protected information is the .NET component.</p> <p>The first alternative for the first secure container is the signed and licensed .NET component. The first rule set is the set of declarative statements comprising the LicenseProviderAttribute in the .NET component.</p> <p>The second alternative for the first secure container is a (signed or unsigned) .NET component with license support contained within a cabinet file signed by the .NET component developer. The first rule set is the set of declarative statements comprising the LicenseProviderAttribute in the .NET component.</p> <p>The third alternative for the first secure container is the signed .msi file in which the .NET component developer packaged its assembly. The first rule set is the conditional syntax statements written by the .NET component developer and placed into the signed .msi file.</p>
storing said first secure container in a first memory;	The first secure container is stored at the .NET component developer's location.
creating a second secure container comprising a second rule set;	<p>The first alternative for the second secure container is a signed .NET assembly and the second rule set is declarative statement(s) within the assembly's header.</p> <p>The second alternative for the second secure container is the signed .msi file in which the .NET assembly developer packages its (signed or unsigned) assembly. The second rule set is the conditional syntax statement(s) written by the .NET assembly developer and placed into the signed .msi file.</p>
storing said second secure container in a second memory;	The second secure container is stored at the .NET assembly developer's location.
copying or transferring at least a first	The .NET assembly developer places the

1	portion of said first protected information	.NET component into the third secure
2	to said second secure container, said	container, which is either a signed cabinet
3	copying or transferring step comprising:	file or a signed .NET assembly.
4	creating a third secure container	When the second secure container is the
5	comprising a third rule set;	signed .msi file, the third secure container
6		is the signed .NET assembly. The third
7		rule set is the declarative statement(s) in
8		the .NET assembly's header.
9		When the second secure container is either
10		a .NET assembly or the signed .msi file, the
11	copying said first portion of said	third secure container is a signed cabinet
12	first protected information;	file in which the .NET assembly developer
13	transferring said copied first portion	placed licensed .NET component. The
14	of said first protected information to	third rule set is the set of declarative
15	said third secure container; and	statements comprising the
16	copying or transferring said copied	LicenseProviderAttribute in the .NET
17	first portion of said first protected	component.
18	information from said third secure	Copying the .NET component to either the
19	container to said second secure	.NET assembly or to the signed cabinet
20	container.	file.
21		Transferring the .NET component to either
22		the .NET assembly or the signed cabinet
23		file.
24		When the second secure container is the
25		signed .msi file and the third secure
26		container is the signed .NET assembly, the
27		.NET assembly is placed into the signed
28		.msi file.
		When the second secure container is either
		the .NET assembly or the signed .msi file
		and the third secure container is the signed
		cabinet file, the signed cabinet file is placed
		into either the .NET assembly or the signed
		.msi file.
87. A method as in claim 85 in which said	The entire .NET component is copied.	
copied first portion of said first protected		
information consists of the entirety of said		
first protected information.		
93. A method as in claim 85 in which		
said step of copying transferring said	When the third secure container is the	
copied first portion of said first protected	signed .NET assembly, it is placed in the	
information from said third secure	signed .msi file.	
container to said second secure container		
further comprises storing said third secure	When the third secure container is a signed	
container in said second secure container.	cabinet file, it can be placed in either the	
	.NET assembly and/or the signed .msi file.	
94. A method as in claim 85 further		
comprising:		
creating a fourth rule set.	When the second rule set is declarative	
	statement(s) within the assembly's header.

	<p>the fourth rule set is the conditional syntax statement(s) written by the .NET assembly developer and placed into the signed .msi file.</p> <p>When the second rule set is the conditional syntax statement(s) written by the .NET assembly developer and placed into the signed .msi file, the fourth rule set is declarative statement(s) within the assembly's header or the set of declarative statements comprising the LicenseProviderAttribute in the .NET component.</p>
95. A method as in claim 94 further comprising:	
using said fourth rule set to govern at least one aspect of use of said copied first portion of said first protected information.	<p>If the fourth rule set is the .NET assembly developer's declarative statement(s) within the .NET assembly's header, it governs the use of the .NET component.</p> <p>If the fourth rule set is the conditional syntax statements of the .NET assembly developer's signed .msi file, it governs the offer/installation of the .NET component.</p>

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019

1	85 (second alternate scenario for .NET)	Infringing products include the .NET Framework SDK, Microsoft Visual Studio .NET, the Microsoft Installer SDK, and products that include the Microsoft .NET CLR, and the Microsoft Installer technology.
2		
3	A method comprising the following steps:	
4	creating a first secure container comprising a first rule set and first protected information;	The first protected information is a .NET component. The first alternative for the first secure container is the signed and licensed .NET component. The first rule set is the set of declarative statements comprising the LicenseProviderAttribute in the .NET component. The second alternative for the first secure container is a (signed or unsigned) .NET component with license support contained within a cabinet file signed by the .NET assembly developer. The first rule set is the set of declarative statements comprising the LicenseProviderAttribute in the .NET component. The third alternative for the first secure container is a .NET component whose hash is included in the assembly header of a .NET assembly. The first rule set is the set of declarative statements comprising the LicenseProviderAttribute in the .NET component.
5		
6		
7	storing said first secure container in a first memory;	The first secure container is stored at the .NET assembly developer's location.
8	creating a second secure container comprising a second rule set;	The second secure container is the signed .msi file in which the .NET assembly developer packages its signed assembly. The second rule set is the conditional syntax statement(s) written by the .NET assembly developer and placed into the signed .msi file.
9		
10		
11		
12	storing said second secure container in a second memory;	The second secure container is stored at the .NET assembly developer's location.
13	copying or transferring at least a first portion of said first protected information to said second secure container, said copying or transferring step comprising:	The .NET assembly developer places the .NET component into the third secure container, which is the signed .NET assembly.
14	creating a third secure container comprising a third rule set;	The third secure container is a signed .NET assembly and the third rule set is

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.

**INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,915,019**

96. A method comprising performing the following steps within a virtual distribution environment comprising one or more electronic appliances and a first secure container, said first secure container comprising a first control set and first protected information:	A signed and licensed .NET component (first container) is part of a .NET assembly (second container), which is packaged in a signed .msi file (third container).
using at least one control from said first control set to govern at least one aspect of use of said first protected information while said first protected information is contained within said first secure container;	The first secure container is a licensed and signed .NET component governed by the set of declarative statements comprising the LicenseProviderAttribute (one control).
creating a second secure container comprising a second control set for governing at least one aspect of use of protected information contained within said second secure container;	The second secure container is a .NET assembly, the protected information is the assembly and the second control set is declarative statement(s) within the assembly's header.
incorporating a first portion of said first protected information in said second secure container, said first portion made up of some or all of said first protected information;	Included in the .NET assembly is the .NET component.
using at least one control to govern at least one aspect of use of said first portion of said first protected information while said first portion is contained within said second secure container; and	The declarative statement(s) govern the use of the .NET component and the custom LicenseProvider class (first control set) controls the .NET component.
incorporating said second secure container containing said first portion of said first protected information within a third secure container comprising a third control set.	The third secure container is the signed .msi file in which the .NET assembly developer packages its assembly. The third control set is the conditional syntax statements written by the assembly developer and placed into the signed .msi file.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 5,949,876

2.	Infringement is based on Microsoft's Visual Studio .NET and/or the .NET Framework licensing tools (in the .NET Framework SDK) and/or Microsoft Installer SDK..
A system for supporting electronic commerce including:	
means for creating a first secure control set at a first location;	<p>The first location is a .NET component developer's site.</p> <p>The first secure control set is the set of declarative statements comprising the <i>LicenseProviderAttribute</i> of a first .NET licensed component that provides for a design-time license to use the control. This attribute also specifies the type of license validation that occurs. The component is encapsulated in a signed .NET assembly.</p>
means for creating a second secure control set at a second location;	<p>The second location is the .NET application developer's site where a .NET application comprising one or more assemblies is created.</p> <p>The second secure control set comprises the declarative statement(s) (including licensing statements, and code access security statements) of a signed .NET assembly using or calling the first .NET component. The control set can include a set of security permissions demanded by the .NET assembly containing the licensed component, whereby the permissions are demanded of components that call the application components. The control set can also be extended by controls expressed as conditional syntax statements in a signed .msi file containing a click through end-user license (the end-user license scenario).</p>
means for securely communicating said first secure control set from said first location to said second location; and	The first .NET control set is securely communicated from the first location developer to the .NET solution provider by either being contained in a signed assembly, within a signed cabinet file or within a signed .msi file.
means at said second location for securely integrating said first and second control sets to produce at least a third control set comprising plural elements together comprising an electronic value chain extended agreement.	<p>At the second location, the solution developer uses the .NET runtime that includes the LicenseManager.</p> <p>Whenever a class (control or component) is instantiated (here, an instance of the first .NET licensed component), the license manager accesses the proper validation mechanism for the control or component. A value chain is created through the creation of a run-time license for use of the first .NET component in the context of use of the .NET application developed at the second location. The</p>

	<p>license controls for the runtime license (derived from the design time license) are bound into the header of the .NET application assembly, along with the second control set.</p> <p>The creation of runtime license controls is securely handled by Visual Studio.NET or the LC tool. Runtime licenses are embedded into (and bound to) the executing assembly. The license control attribute included in the first .NET component is customized in the second location to express and require the runtime license. In a different scenario, the LC tool is used to create a ".licenses file" containing licenses for multiple components, including runtime licenses for components and classes created by the license provider. This .licenses file is embedded into the assembly.</p> <p>The third control set is an extended value chain agreement that comprises the runtime license controls for the first .NET licensed class (that had been bound to the assembly), the declarative controls provided by the solution provider in the solution provider's assembly, and any runtime licenses for other components included by the solution provider in the solution provider's assembly, and any end user license agreement provided by the application provider. The controls are typically integrated into the header of the .NET application assembly calling the first .NET licensed component.</p> <p>A further "end user licensing scenario" occurs when, at the second location, the application developer packages the application into a signed .msi file that includes conditional syntax statement controls that require that a user read and agree to an end user license agreement for the application and the embedded first component. The third control set includes a plurality of elements that include the runtime licenses mentioned above, security permissions controls, EULA controls (a fourth control set), all securely bound into the signed .msi file.</p>
--	---

11. A system as in claim 2 in which said first location and said second location are contained within a Virtual Distribution Environment.	The Microsoft .NET Framework provides a Virtual Distribution Environment. Here the nodes are the Common Language Runtime instances that interpret the controls contained within .NET assemblies (among other functions).
29. A system as in claim 2 in which said first secure control set includes required	The licensing control in the first control set specifies the method required to validate

1	terms.	the license.
2	32. A system as in claim 2 in which said	The security permissions demanded (as
3	second secure control set includes required	described above) are required terms for
4	terms.	execution of the application code elements.
5	60. A system as in claim 2 in which said	In the scenario where the application
6	means for securely integrating said first and	assembly is distributed using a signed .msi
7	second control sets includes a fourth	file, the secure integration of the first and
8	control set.	second control sets is enhanced by the
9		tamper protection afforded by the signed
10		.msi file. In the end user license scenario, a
11		fourth control set consisting of conditional
12		syntax statements is included in the .msi
13		file.
14	130. A system as in claim 2 further	The third control set is executed under the
15	including means for executing said third	auspices of the CLR.
16	control set within a protected processing	
17	environment.	
18	132. A system as in claim 130 in which	The third control set is executed at an end-
19	said protected processing environment is	user site within the CLR.
20	located at a location other than said second	
21	location.	
22	161. A system as in claim 2 in which said	In the end user license scenario, the third
23	third control set includes controls	control set includes a fourth control set that
24	containing human-language terms	requires that the human user agree with
25	corresponding to at least certain of the	license terms displayed to the user. These
26	machine-executable controls contained in	human readable terms are referenced in the
27	said third control set.	conditional syntax statement controls
28		contained in the signed .msi file.
29	162. A method as in claim 161 in which	The .msi file is a data descriptor data
30	said human-language terms are contained	structure.
31	in one or more data descriptor data	
32	structures.	
33	170. A system as in claim 2 in which said	The creation of the first licensed
34	means for creating a first secure control set	component, including its licensed controls
35	includes a protected processing	is carried out under the auspices of the
36	environment.	CLR.
37	171. A system as in claim 2 in which said	The application design time environment
38	means for creating a second secure control	and the creation of the .NET application is
39	set includes a protected processing	carried out under the auspices of the CLR.
40	environment.	
41	172. A system as in claim 2 in which said	The means for integrating the runtime
42	means at said second location for securely	license with the application controls is
43	integrating includes a protected processing	carried out under the auspices of the CLR.
44	environment.	
45	329. A system as in claim 2 in which said	VS.NET runs under Windows.

1	means for creating a first secure control set	
2	includes an operating system based on or compatible with Microsoft Windows.	
3		
4	330. A system as in claim 2 in which said means for creating a second secure control set includes an operating system based on or compatible with Microsoft Windows.	VS.NET runs under Windows.
5		
6	331. A system as in claim 2 in which said means at said second location for securely integrating said first and second control sets includes an operating system based on or compatible with Microsoft Windows.	VS.NET runs under Windows.
7		
8		
9	346. A system as in claim 2 further comprising means by which said third control set governs the execution of at least one load module.	The third control set in the scenario described in the claim map for claim 2 governs a portable .NET executable designed to be loaded into the CLR environment (a CLR host).
10		
11		
12	347. A system as in claim 2 farther comprising means by which said third control set governs the execution of at least one method.	The third control set in the scenario described in the claim map for claim 2 governs a .NET executable. This executable contains one or more methods.
13		
14		
15	349. A system as in claim 2 further comprising means by which said third control set governs the execution of at least one procedure.	The third control set in the scenario described in the claim map for claim 2 governs a .NET executable. This executable contains one or more procedures.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,112,181

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
48.	Infringing products include Microsoft SMS (Systems Management Server) 2.0 and subsequent versions.
A method for narrowcasting selected digital information to specified recipients, including:	
a) at a receiving appliance, receiving selected digital information from a sending appliance remote from the receiving appliance,	The <i>receiving appliance</i> is the client (e.g., end user computer in an Enterprise setting) receiving <i>digital information</i> (packages and/or advertisement files) from the <i>sending appliance</i> , the centralized SMS database via a Client Access Point and/or Distribution Point set up on a server.
the receiving appliance having a secure node and being associated with a specified recipient;	The "node" is "secure" as a result of SMS security, as well as how it identifies and selects clients. The "specified recipient" is the result of the <i>collection</i> identifying a specific client that meets the criteria for a package or advertisement.
i) the digital information having been selected at least in part based on the digital information's membership in a first class, wherein the first class membership was determined at least in part using rights management information; and	The <i>digital information</i> is a software package or advertisement. The " <i>first class membership was determined in part using rights management information</i> " reads on creating software packages (or advertisements) based on attributes of the software.
ii) the specified recipient having been selected at least in part based on membership in a second class, wherein the second class membership was determined at least in part on the basis of information derived from the specified recipient's creation, use of, or interaction with rights management information; and	The "specified recipient" is the client selected to receive a package or advertisement. That recipient is chosen based on a collection rule, or on the recipient's possession of a license.
b) the specified recipient using the receiving appliance to access the received selected digital information in accordance with rules and controls, associated with the selected digital information,	The <i>receiving appliance</i> is the client computer. The SMS agents on the client computer receive, evaluate and take the appropriate action based on <i>rules and controls</i> governing the package and/or advertisement (i.e. the <i>selected digital information</i>).
the rules and controls being enforced	Rules and controls are enforced by Agents on

1	by the receiving appliance secure node.	the client (the <i>secure node</i>)
2		
3		
4	59. The method of claim 48 wherein said received selected digital information is at least in part event information.	Event information includes SMS event information, including <i>Scheduling Classes</i> .
5		
6	63. The method of claim 48 wherein said received selected digital information is at least in part executable software.	All SMS packages must include a minimum of one program.
7		
8	70. The method of claim 48 wherein said rules and controls at least in part govern usage audit record creation.	A control governs whether a MIF (management information file) is sent back to the SMS db after installation is done to report on the success or failure of the installation.
9		
10	89. The method of claim 48 wherein said receiving appliance is a personal computer.	The primary purpose of SMS is to manage software on personal computers throughout the Enterprise.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,112,181

CLAIM LANGUAGE	CLAIM INFRINGEMENT
48.	Infringing products include Windows Media Player and Windows Media Rights Manager.
A method for narrowcasting selected digital information to specified recipients, including:	This claim pertains to Windows Media Player with Individualized DRM Client and Windows Media Rights Manager used in the context of a narrowcast pay-per-view (hear) media distribution service., simulcast and/or subscription services.
(a) at a receiving appliance, receiving selected digital information from a sending appliance remote from the receiving appliance, the receiving appliance having a secure node and being associated with a specified recipient	Receiving appliance is a user's PC with individualized DRM client (secure node). Specified recipient is a user using the specific individualized DRM client to access and render narrowcast pay-per-view media, simulcast and/or subscription services for which the user acquires a license.
(i) the digital information having been selected at least in part based on the digital information's membership in a first class, wherein the first class membership was determined at least in part using rights management information; and	The digital information is media that is narrowcast to licensed recipients. These narrowcast streams are licensed to users who have acquired licenses and whose PCs (appliances) support WMPs that have individualized DRM clients. This attribute is included in the signed WMA file header and is used in the process of acquiring licenses for access to the media. Media that are licensed to the recipient have their licenses bound to the recipient's Individualization module.
(ii) the specified recipient having been selected at least in part based on membership in a second class, wherein the second class membership was determined at least in part on the basis of information derived from the specified recipient's creation, use of, or interaction with rights management information; and	The recipient is selected for this content based on the fact that the recipient is a member of the class of recipients who have a license for the narrowcast media and whose devices support WMP and individualized DRM clients. The recipient's machine must indicate support for individualization in challenges that are sent as part of requests for media in this narrowcast class.
(b) the specified recipient using the receiving appliance to access the received selected digital information in accordance with rules and controls, associated with the selected digital information, the rules and controls being enforced by the receiving appliance secure node.	Recipient's machine uses WMP and the individualized DRM client to access the narrowcast media in accordance with all rules associated with the media and contained in the media license – in particular, requirements that individualization be supported.

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
61. The method of claim 48 wherein said received selected digital information is at least in part entertainment information.	The digital information is Windows Media, which encodes audio/visual entertainment content.
62. The method of claim 61 wherein said entertainment information is at least in part music information.	Reads on narrowcast Windows Media Files that are music or audio/visual.
67. The method of claim 48 wherein said rules and controls at least in part use digital certificate information.	The license contains a digital certificate. The DRM client uses the certificate in the license to verify this signature and to verify that the header has not been tampered with.
72. The method of claim 48 wherein said rules and controls in part specifying at least one clearinghouse acceptable to rightsholders.	The signed header contains at least one URL that indicates to the Windows Media Rights Manager the license clearinghouse to be used in acquiring licenses.
75. The method of claim 72 wherein said at least one acceptable clearinghouse is a rights and permissions clearinghouse.	This clearinghouse is a license clearinghouse responsible for mapping rights and permissions onto requested content or narrowcasts and binding them to the requesting client environment or user of this environment.
89. The method of claim 48 wherein said receiving appliance is a personal computer.	Windows Media Player and the Individualized DRM client run on a personal computer.

INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,112,181

91	Infringing products include Windows Media Player and Windows Media Rights Manager
A method for securely narrowcasting selected digital information to specified recipients including:	This claim pertains to Windows Media Player with Individualized.DRM Client and Windows Media Rights Manager used in the context of a narrowcast simulcast, pay-per-view (hear) media distribution service, and/or subscription services. The content is delivered in a Protected Windows Media File.
(a) receiving selected digital information in a secure container at a receiving appliance remote from a sending appliance, the receiving appliance having a secure node, the receiving appliance being associated with a receiving entity	Narrowcast content is received in a Protected Windows Media File. Receiving appliance is user's PC with individualized DRM client (secure node).
(i) the digital information having been selected at least in part based on the digital information's membership in a first class,	The digital information is media that is narrowcast to licensed recipients (for example, a sold-out concert is narrowcast on the Internet to "the class of" licensed (or ticketed) viewers).
(ii) the first class membership having been determined at least in part using rights management information	These narrowcast streams are licensed to users who have acquired licenses and whose PCs (appliances) support WMPs that have individualized DRM clients. This attribute is included in the signed WMA file header and is used in the process of acquiring licenses for access to the media. Media that are licensed to the recipient have their licenses bound to the recipient's individualization module.
(b) the receiving entity having been selected at least in part based on said receiving entity's membership in a second class,	The recipient is selected for this content based on the fact that the recipient is a member of the class of recipients who has a license for the narrowcast media.
(i) the second class membership having been determined at least in part on the basis of information derived from the recipient entity's creation, use of, or interaction with rights management information	The recipient class is determined by the license bound to the user's device that supports WMP and individualized DRM clients. The recipient's machine must indicate support for individualization in challenges that are sent as part of requests for media in this narrowcast class.
(c) receiving at the receiving appliance rules and controls in a secure container,	Receives a protected Windows Media File
(i) the rules and controls having been associated with the selected digital information; and	Receives a license that is bound to the file as well as to the specific DRM client individualization information.
(d) using at the receiving appliance the selected digital information in accordance	Recipient's machine uses WMP and the individualized DRM client to access the

		personal computer.

INTERTRUST TECHNOLOGIES CORP. v. MICROSOFT CORP.
INTERTRUST INFRINGEMENT CHART
FOR U.S. PATENT NO. 6,389,402

CLAIM LANGUAGE	CLAIM OF INFRINGEMENT
1.	Products infringing: Microsoft Visual Studio .NET, .NET License Compiler, .NET Framework SDK, and .NET Common Language Runtime
A method including	A method for producing a third .NET component (application) that incorporates first and second .NET component whose distribution is license controlled.
creating a first secure container including a first governed item and having associated a first control;	The <i>first secure container</i> is a first signed .NET component that includes a license control. The <i>governed item</i> is the .NET component. The <i>first control</i> is the set of declarative statements comprising the LicenseProviderAttribute of a first .NET licensed component that provides for a design-time license to use the control. This attribute also specifies the type of license validation that occurs.
creating a second secure container including a second governed item and having associated a second control;	The <i>second secure container</i> is the second signed .NET component that includes a license control. The <i>governed item</i> is the .NET component. The <i>second control</i> is the set of declarative statements comprising the LicenseProviderAttribute of a second .NET licensed component that provides for a design-time license to use the control. This attribute also specifies the type of license validation that occurs.
transferring the first secure container from a first location to a second location;	The creator distributes a signed and licensed .NET component. An application developer at a second location downloads a first .NET component for inclusion into an application.
transferring the second secure container from a third location to the second location;	A creator distributes a signed and licensed .NET component from a different location. Application developer downloads a second .NET component for inclusion into an application.

at the second location, obtaining access to at least a portion of the first governed item, the access being governed at least in part by the first control;

At the *second location*, the application developer uses the .NET runtime that includes the LicenseManager to access a *first governed item*.

Whenever a class (control or component) is instantiated (here, an instance of the first .NET licensed component), the license manager accesses the proper validation mechanism for the control or component.

The *first control* comprises the declarative statement(s) (including licensing statements, and code access security statements) of the first .NET component.

at the second location, obtaining access to at least a portion of the second governed item, the access being governed at least in part by the second control;

At the *second location*, the application developer uses the .NET runtime that includes the LicenseManager to access a *second governed item*.

Whenever a class (control or component) is instantiated (here, an instance of the second .NET licensed component), the license manager accesses the proper validation mechanism for the control or component.

The *second control* comprises the declarative statement(s) (including licensing statements, and code access security statements) of the second .NET component.

at the second location, creating a third secure container including at least a portion of the first governed item and at least a portion of the second governed item and having associated at least one control, the creation being governed at least in part by the first control and the second control.

At the *second location*, the application developer uses the .NET runtime that includes the LicenseManager to access a *first governed item* and *second governed item* to construct an application, the *third secure container*.

Creation governance is accomplished by invoking the .NET runtime to access the *first governed item* and the *second governed item*.

Whenever a class (control or component) is instantiated the license manager accesses the proper validation mechanism for the control or component.

The *portions* of the first governed item and second governed item that are being included in the third secure container will typically include the governed items themselves, ie. the .NET components.

The *associated control* in this case is the LicenseProviderAttribute, created and inserted into the application.
